PREFACE

This book has been written for the students of Class X of Secondary Schools affiliated to the Central Board of Secondary Education (CBSE), New Delhi, according to new syllabus developed by National Council of Educational Research and Training (NCERT), New Delhi, under the National Policy of Education.

In fact, it is an effort made to cater to the needs of the average students and the brighter students as well who have to learn Mathematics as a compulsory subject. Learning of Mathematics is essential for them to study other subjects as an integrated course and to face multi-dimensional and challenging situations in days to come. To make learning of the subject interesting and meaningful to the day-to-day needs of would be citizens, I have presented the contents in a new format which is based on my long experience of teaching the subject and varied writing experience of text-books on Mathematics.

The following are the special features of the book:

- 1. The emphasis has been laid on the clear understanding of basic concepts and principles by the students.
- 2. Treatment of the subject matter is simple and logical. The matter has been developed successively with the help of previous knowledge of the students.
- Each chapter comprises several functional units and each unit is designed to cover one or two teaching periods.
- 4. Numerous worked-out examples have been provided for better understanding of the contents by the students and to explain the methodical working of the problems fully.
- 5. There are sufficient well-graded questions related to our daily life in each exercise. Each exercise has been divided into three Sections A, B and C. Section A consists of objective or short-answer questions, while Section B has simple applications and Section C has more difficult questions.
- 6. After each chapter a review exercise has been added, enriched by the inclusion of questions set in public examinations for effective revision side by side.
- 7. Working rules, important results and points worth remembering and deductions are given at appropriate places.
- 8. Wherever necessary hints have been provided to help students to solve difficult questions with confidence.

- 9. The figures, diagrams and graphs given in the book are complete, neatly drawn and self-explanatory.
- Only agreed conventions, popular symbols or notations and metric units have been used throughout the book.
- 11. Answers to questions have been carefully checked for their correctness and accuracy.

I am indebted to Dr. Vijay Bhushan Aggarwal, Founder Head of the Deptt. of Computer Science, Delhi University for writing Chapter 12 on Computing II in the book.

I would like to request my fellow teachers and pupils to send their constructive criticism so that the book may be improved in its future editions.

Ashok Vihar, Delhi

RAJENDRA PRASAD GOEL

SYLLABUS IN MATHEMATICS FOR CLASS X PRESCRIBED BY CBSE

One	Paper	3 Hours	S		Marks: 100
UN	1TS	Marks			Marks
1.	Algebra	30	4.	Geometry	30
2.	Arithmetic and Mensuration	10	5.	Statistics	08
3.	Trigonometry	12	6.	Computing (II)	10

Unit I: Algebra

Linear equations in two variables. Linear equations in two variables and its graph. System of two linear equations in two variables, Solution of the system of equations by graphical method. Consistency/inconsistency of the equations.

Algebraic method of the solution of a system of equations. Applications involving the

system of equations from different areas.

Rational Expressions. Meaning of a rational expression, addition, subtraction, multiplication of rational expressions. Factorization of expressions involving cyclic factors, Ratio and proportion, Componendo, dividendo, alternendo, invertendo, etc , and their application. Ouadratic Equation. Meaning and standard form of a quadratic equation $ax^2+bx+c=0$, $a\neq 0$

Solution of $ax^2+bx+c=0$, $a\neq 0$ (i) by factorization (ii) by quadratic formula. Discriminant of the quadratic equation and nature of the roots. Applications involving quadratic

equation and nature of the roots.

Applications involving quadratic equation from several areas.

Solution of equations reducible to quadratic form. Factorization of quadratic polynomials by using quadratic formula (when other methods are not easily applicable)

Unit II: Arithmetic and Mensuration

Area and Volume. Review of concepts such as area of a circle, sector, segment; surface areas and volumes of cubes, cuboids, cones, cylinders, spheres; area of four walls of a room studied in earlier classes and solution of problems (of higher difficulty level), using logarithmic tables for computational work.

Unit III: Trigonometry (20 Periods)

Trigonometrical Identities. sin² A+cos² A=1; sec² A=1+tan² A; cosec² A=1+cot² A Proving simple identities based upon the above.

Trigonometrical ratios of complementary angles

 $\sin (90^{\circ} - A) = \cos A$, $\csc (90^{\circ} - A) = \sec A$, $\cos (90^{\circ} - A) = \sin A$, $\sec (90^{\circ} - A) = \csc A$, Simple problems based upon the above

 $\tan (90^{\circ} - A) = \cot A, \cot (90^{\circ} - A) = \tan A.$ Heights and Distances. Reading of trigonometrical tables. Solution of simple problems on heights and distances, using trigonometrical tables and logarithmic tables.

Unit IV : Geometry

A number of propositions in Geometry are listed below. Most of them have already been learnt at the Upper Primary stage by verification/experiments. At the Secondary stage the purpose is to acquaint the pupil with the nature and method of a geometrical proof. In order to see that the burden on the pupil is not much it may not be necessary to give proofs for all the propositions. So, a few of these may be selected in such a way that they reflect types of proof like direct proof, proof by contradiction, proof by exhaustion, proofs using various criteria like SAS, SSS etc. But there should be a large number of exercises where the pupil will be required to prove riders, applying the knowledge and understanding of the various theorems, so that the pupil develops the ability of identifying the inter-relationship between different parts of the problems and draws conclusions through reasoning, which is one of the main objectives of teaching Mathematics in general and Geometry in particular.

Similar Triangles

*1. If a line is drawn parallel to one side of a triangle, the other two sides are divided

in the same ratio.

2. If a line divides any two sides of a triangle in the same ratio, the line is parallel to

3. If in two triangles, the corresponding angles are equal (i.e., if the two triangles are the third side. equiangular), their corresponding sides are proportional (Axiom).

4. If the sides of two triangles are proportional the triangles are equiangular (Axiom). 5. If corresponding angles of two triangles are equal, then the triangles are similar

6. If corresponding sides of two triangles are proportional, then the triangles are (Axiom). similar (Axiom).

7. If one angle of a triangle is equal to one angle of the other and the sides including

these angles are proportional, the triangles are similar (Axiom).

8. If a perpendicular is drawn from the vertex of the right angle of a right triangle to the hypotenuse, the triangles on each side of the perpendicular are similar to the whole triangle and to each other.

*9. The ratio of the areas of similar triangles is equal to the ratio of the squares on the

corresponding sides.

*10. In a right triangle, the square on the hypotenuse is equal to the sum of the squares on the other two sides.

*11. In a triangle, if the square on one side is equal to the sum of the squares on the remaining two, the angle opposite the first side is a right angle.

Circles. 1. Two circles are congruent if and only if they have equal radii.

2. If the areas of a circle are congruent, their corresponding chords are equal and its

converse.

- 3. A perpendicular from the centre of a circle to a chord bisects the chord and conversely, the line drawn through the centre of a circle to bisect a chord is perpendicular to the chord.
 - 4. There is one and only one circle passing through three given non-collinear points.
- 5. Equal chords of a circle (or of congruent circles) are equidistant from the centres and conversely, chords of a circle (or of congruent circles) that are equidistant from the centres are equal.

*6. The angle subtended by an arc at the centre is double the angle subtended by it at

any point on the remaining part of the circle.

*7. The angle in a semi-circle is a right angle and its converse.
*8. Angles in the same segment of a circle are equal.

9. If a line segment joining two points subtends equal angles at two other points lying on the same side of the line containing the segment, the four points lie on the same circle.

10. Equal chords subtend equal angles at the centre and conversely, if the angles

subtended by the chords at the centre (of a circle) are equal, then the chords are equal.

11. Two arcs of a circle are congruent if the angles subtended by them at the centre

are equal and its converse.

*12. The sum of the opposite angles of either pair of a cyclic quadrilateral is 180° and conversely, if a pair of opposite angles of a quadrilateral are supplementary then the quadrilateral is cyclic (proof of converse not required).

13. A tangent at any point of a circle is perpendicular to the radius through the point

of contact.

14. The lengths of two tangents from an external point to a circle are equal.

15. If two chords of a circle intersect inside or outside the circle then the rectangle formed by the two parts of one chord is equal in area to the rectangle formed by the two parts of the other.

*16. If PAB is a secant to a circle intersecting the circle at A and B and PT is a

tangent, then PA×PB=PT2.

*17. If a line touches a circle and from the point of contact a chord is drawn, the angles which this chord makes with the given line are equal respectively to the angles formed in the corresponding alternate segments, and the converse.

18. If two circles touch each other, the point of contact lies on the line joining their

centres.

Note: Proofs of Theorems starred (*) are to be done.

Constructions. 1. Construction of a circum-circle and an incircle of a triangle. 2. Construction of a triangle, given base, vertical angle and either altitude or median through vertex. 3. Construction of a cyclic quadrilateral with one vertex angle as a right angle. 4. Construction of figures (triangles, quadrilaterals, etc.) similar to the given figures as per the given scale factor.

Unit IV: Statistics

Mean of grouped data, Median of ungrouped data.

Descriptive explanation of mortality tables, cost of living index, price index. etc.

Unit V: Computing (II)

Flow charts involving loops—algorithms for mathematical problems already studied from topics such as profit and loss, ratio and proportion, simple and compound interest, discount; HCF and LCM etc.—Easy exercises.

LINEAR EQUATIONS IN TWO VARIABLES

1.1. LINEAR EQUATIONS IN TWO VARIABLES

You have learnt about linear equations in one variable in your previous class. A linear equation in one variable is of the form ax+b=0, where a and b are real numbers and $a\neq 0$. Here a is the co-efficient of x and b is the constant term. You have also learnt how to solve such equations. The solution of ax+b=0 is $x=-\frac{b}{a}$. We also say that $-\frac{b}{a}$ is the root of the equation.

Consider the following equations:

$$x-y=3$$
, $3x+5y=9$, $\frac{3}{8}x=\frac{5}{6}-\frac{3}{5}y$

Each of these equations contains two variables x and y and real numbers. These are linear equations in two variables over R.

An equation in two variables x, y is said to be linear, if it is of the form ax+by+c=0, where a, b, $c \in R$ and $a \neq 0$, $b \neq 0$.

Here a is called the co-efficient of x, b is called the co-efficient of y and c is the constant term.

Consider the equation given below:

$$x+y=5$$

[Domain of the variables is R]

When we assign any value to x, we find a unique value of y.

If x=1, then y=4. So ordered pair (1, 4) makes the equation true.

If x=2, then y=3, the ordered pair (2, 3) also makes the above equation true.

If x=0, then y=5, the ordered pair (0, 5) also makes the given equation true.

We say that the ordered pairs (1, 4), (2, 3) and (0, 5) are solutions of the given equation.

Are these the only solutions of the given equation?

Other such ordered pairs are (3, 2), (4, 1), (5, 0), (0, 5). You can go on assigning real values to one variable. In each case you will be getting the corresponding value for the other variable such that the ordered pairs so obtained make the equation *true*.

The set of these ordered pairs in an infinite set. Each ordered pair corresponds to a point on a real number plane.

Let us consider the equation x+y=7.

This is a linear equation in x and y over R.

By giving real values to x, we get the corresponding values of y which make the equation true.

Thus, there are infinite number of ordered pairs which are the solutions of the given equation.

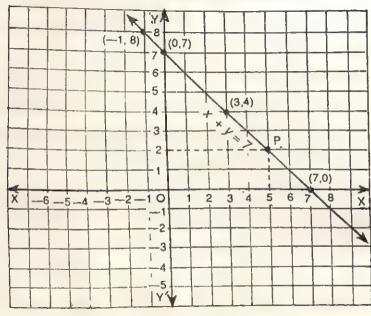

Let us write some of these in the form of a table, as given below:

x=	0	3	7	-1	-3
<i>y</i> =	7	4	0	8	10

Let us plot all those points whose coordinates are these ordered pairs.

What do you observe?

Are these points collinear?

By plotting these points, we find that they all lie on a line.

We say that the graph of the linear equation x+y=7 is a line. The coordinates of any point on the line will satisfy this equation. Let us take a point P on the line whose coordinates are (5, 2). Now x=5 and y=2 satisfy the equation x+y=7. We, thus, see that any point on the graph of x+y=7 gives us a solution of the equation. Note that it is true for every linear equation in two variables over R.

Hence, the graph of ax+by+c=0 is a line and every point on the graph of ax+by+c=0 gives a solution of the equation.

Although we need to plot only two points to determine the graph of a linear equation over the real numbers, it is a good practice to plot a third point as a check.

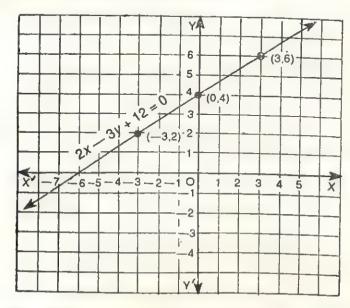

Example 1. Draw the graph of the solution set of the equation

$$2x-3y+12=0, x, y \in R.$$
Solution. $2x-3y+12=0$
or $-3y=-2x-12$ or $3y=2x+12$

$$y=\frac{2x+12}{3}$$

$y = \frac{2x + 12}{3}$	x=	0	3	-3
	<i>y=</i>	4	6	2

Let us plot the ordered pairs (0, 4), (3, 6) and (-3, 2).

By joining these points, we get a line which is the required graph of the equation 2x-3y+12=0.

Note that the solution set consists of all the points on the line.

In case of fractional numbers in ordered pairs, choose a suitable scale for plotting the points.

EXERCISE 1 (a)

(Section A)

Draw the graph of the solution set of each of the following equations:

1.
$$x=4$$
.

2.
$$y = -5$$
.

3.
$$x+y=0$$
.

4.
$$x+8=0$$
.

5.
$$y=9$$
.

6.
$$x-y=0$$

7.
$$x+y=6$$
.

8.
$$x+y+7=0$$

9.
$$x=2y$$
.

(Section B)

Draw the graphs of the following equations:

10.
$$4x-y-5=0$$
.

11.
$$3x+5y=15$$
.

12.
$$2y-x=6$$
.

13.
$$5x-3y=10$$
.

14.
$$\frac{x}{4} - \frac{y}{3} = 1$$
.

15.
$$4x+7y+28=0$$
.

1.2. SYSTEM OF EQUATIONS

A pair of linear equations in two variables can be compounded by the connective 'and'.

Then the compounded equations form a system of linear equations in two variables.

A system of equations is usually written as:

$$2x-y=7$$
 and $3x-2y=9$; $\begin{cases} 2x-y=7\\ 3x-2y=9 \end{cases}$

The truth set of the system will consist of the common solutions of the constituent equations i.e., the truth set of the system is the intersection of the truth sets of the constituent equations.

The graph of a linear equation in two variables is a line. When we draw graphs of two such equations on the same axes, we get two distinct lines in the same cartesian plane.

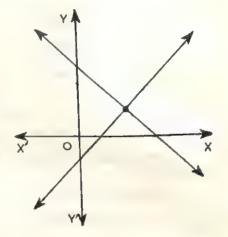

Any pair of lines in the same plane

- (i) may intersect in just one point,
- (ii) may intersect in an infinite number of points i.e., may coincide,
- (iii) may not intersect at all i.e., may be parallel.

Thus, the truth set of a given system of linear equations may contain one element or an infinite number of elements or no elements.

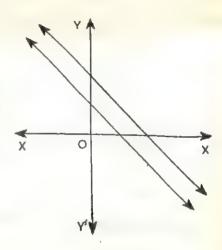

Here the two lines, representing graphs of given equations meet only at one point. So, these equations have only one common solution.

If a system of equations has only one solution, it is called consistent.

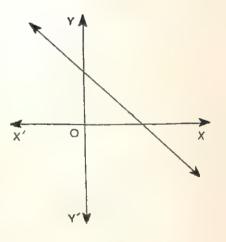

Here the two lines, representing graphs of given equations do not intersect at all i.e., they are parallel. So, these equations have no common solution.

If the system of equations has no solution, it is called inconsistent.

Here the two lines, representing graphs of given equations coincide with each other. So, these equations have infinite number of common solutions.

If a system of equations has an infinite number of solutions, it is called dependent.

Example 2. Graph the solution set of the system of equations:

$$\begin{cases} 4x - 3y = 5 \\ 4x - 3y = 9 \end{cases}$$

State which type of system it is.

Solution. (1) Let us draw the graph of the first equation.

$$4x - 3y = 5$$

$$4x - 3y = 5$$
 or $4x - 5 = 3y$

Then
$$y = \frac{4x-5}{3}$$

x=	2	5	-1
y=	1	. 5	-3

On plotting the points (2, 1), (5, 5) and (-1, -3), we get the line p.

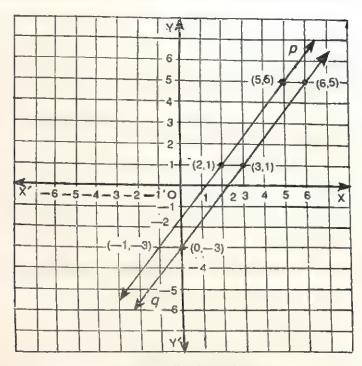

(2) Let us draw the graph of the second equation on the same axes.

$$4x - 3y = 9$$
 or $4x - 9 = 3y$

Then
$$y = \frac{4x-9}{3}$$

x=	0	3	6
<i>y</i> =	-3	1	5

On plotting the points (0, -3), (3, 1) and (6, 5), we get the line q.

Scale-1 division=1 unit

(3) We note that lines p and q are parallel. So, there is no solution for the system of equations.

The system of equations is inconsistent.

Example 3. Graph the solution of the system of equations

$$4x - 3y = 5$$
$$x + 2y = 4$$

State which type of system it is.

Solution. (1) Taking the first equation,

$$4x-3y=5$$
 or $3y=4x-5$ or $y=\frac{4x-5}{3}$

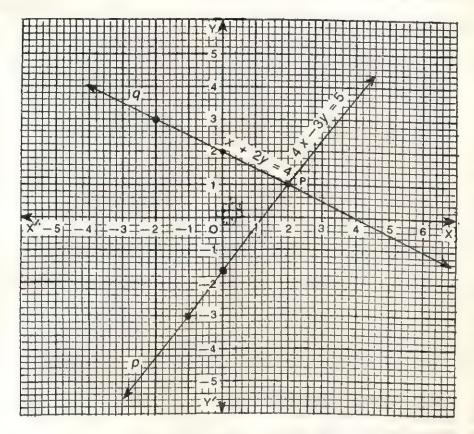

x=	2	-1	0
$y = \frac{4x - 5}{3}$	1	-3	$-\frac{5}{3}$

On plotting the points (2, 1), (-1, -3), $(0, -\frac{5}{3})$, and joining them, we get line p. Taking the second equation, x+2y=4

or
$$2y = 4 - x$$
 or $y = \frac{4 - x}{2}$

X==	0	2	2
$y = \frac{4-x}{2}$	2	3	I

Plotting the points (0, 2), (-2, 3), (2, 1) and joining them, we get line q.

Scale -5 divisions = 1 unit

The graphs of two equations i.e., lines p and q intersect each other at the point P only whose coordinates are (2, 1). So, the solution of the system is x=2, y=1.

Hence, the system of equations is consistent.

EXERCISE 1 (b)

(Section A)

Solve the following systems of linear equations graphically:

1.
$$x+y=5$$

2.
$$x-y=3$$

3.
$$2x+y=12$$

$$x-y=3$$
.

$$x+y=1$$
.

$$x+y=10.$$

(Section B)

Solve each of the following systems of linear equations by drawing their graphs:

4.
$$2x + 3y = 8$$

5.
$$2x-3y=12$$

6.
$$y-x+2=0$$

$$x+2y=5$$
.

$$2x + 3y = 24$$
.

$$x-2y-4=0$$
.

7. Solve the following equations graphically:

$$3x+2y=6$$
 and $4y-5x=1$,

taking 2 cm to represent one unit on both the axes.

8. Taking 1 cm to represent 1 unit on each axis, draw graphs of the equations

$$x+2y=7 \text{ and } y-3x=1$$

and find their solution.

9. Solve the following system of equations graphically, taking 2 cm to represent one unit on both the axes:

$$3x-y+4=0$$
, $5x+y+4=0$.

10. Solve the following equations graphically, taking 2 cm=1 unit on each axis:

$$4x+3y=5$$
$$x-2y=-7.$$

(Section C)

Draw the graphs of the following systems of simultaneous equations and find the solution set in each case. Determine whether these systems are (a) consistent, (b) dependent, (c) inconsistent

11.
$$5x-3y=11$$

 $3x+y=15$.

14. 3y-2x=7

12.
$$x+3y-7=0$$

 $2x+6y-14=0$.

13.
$$2x = 8 + 3y$$

15.
$$2x+3y=13$$

$$4x=6y+5$$
.
16. $4x-y-31=0$

$$5x + 3y = -7$$

$$5x-2y=4$$
.

$$5x-24y-16=0$$
.

You have learnt graphical method of solving two simultaneous linear equations in two variables. Quite often the graphical method is not convenient specially when coordinates of points are fractional numbers. To avoid inaccuracies that can occur in the drawing of graphs, the algebraic methods of solving simultaneous equations are used. The first step in solving these equations is to obtain a simple equation having only one variable. This can be done in three ways:

- (1) Method of equalizing coefficients.
- (2) Method of substitution.
- (3) Method of comparison.

Example 4. Solve

$$4x + 3y = 25$$

$$7x + 8y = 52$$

Solution. Let us name the equations,

$$4x + 3y = 25$$

$$7x + 8y = 52$$

...(2)

Here the coefficients of neither x nor y in the two equations are the same.

We multiply both sides of equation (1) by 7 and equation (2) by 4.

$$28x + 21y = 175$$

...(3)

$$28x + 32y = 208$$

...(4)

Now the numerical coefficients of x in equations (3) and (4) are the same.

We subtract (3) from (4) to eliminate x.

$$11\nu=33$$

$$\therefore y=3$$

...(1)

...(2)

To find x, we substitute y=3 in (1).

$$4x+3\times 3=25$$
 or $4x=25-9$ or $4x=16$ $\therefore x=4$

So, x=4, y=3

Hence, the solution set is $\{(4, 3)\}$.

Note that the system is consistent.

This method of elimination consists of the following steps:

- (1) We multiply both the equations by such numbers so as to make the co-efficients of one of the two unknowns numerically the same.
- (2) Then we add or subtract so as to get an equation containing only the other unknown. By solving this equation, we get the value of the one unknown.
 - (3) We substitute the value of this unknown in either of the equations.

By solving that, we get the value of the other unknown.

EXERCISE 1 (c)

(Section A)

Solving the following systems of equations:

1.
$$x+y=10$$

 $2x-3y=5$.
2. $x+y-5=0$
 $-2x+y=2$.
3. $3x-4y=5$
4. $4x-3y=4$

3.
$$3x-4y=5$$

 $5x+2y=17$.
4. $4x-3y=4$
 $2x+5y=15$.
5. $x-2y=5$
6. $2x-3y=11$

5.
$$x-2y=5$$

 $3x-4y=13$.

6. $2x-3y=11$
 $3x-y=6$.

(Section B)

Solve each of the following systems of equations:

7.
$$3x+y=4$$

 $y-4x=3$
9. $x+y=10$
 $2x-y=1$
8. $x-2y=2$
 $5x+5y=4$
10. $x-2y=13$
 $y=7x+6$

2x-y=1
$$y=7x+6$$
.
Example 5. Solve $x+7y=21$
 $5x-17y=1$
Solution. $x+7y=21$

5x-17y=1We transform the first equation to obtain x in terms of y.

From equation (1), we get x=21-7y.

We substitute the expression for x in the equation (2).

or
$$5(21-7y)-17y=1$$

or $105-35y-17y=1$
or $-52y=1-105$
or $-52y=-104$
 $y=2$.

Then we substitute this value of y in equation (1) to obtain the value of x.

or
$$x+7\times 2=21$$
or $x+14=21$
 $x=7$

The solution is x=7, y=2.

This method of substitution consists of the following steps:

- (I) From either of the given equations, we express one of the two unknowns in terms of the other.
- (2) We substitute the value of unknown thus expressed in the other equation.

 By solving this equation, we get the value of one unknown.
- (3) We substitute the value of this unknown in either of the equations.

 By solving that, we get the value of the other unknown.

EXERCISE 1 (d)

(Section A)

Solve the following systems of equations:

1.
$$2x-3y=7$$

 $5x+y=9$.

2.
$$2x+3y=8$$

 $4x=4+6y$.

3.
$$15x-8y=29$$

 $17x+12y=75$.

4.
$$8x+13y-29=0$$

 $12x-7y-17=0$.

Solve each of the following systems of equations:

5.
$$2x+7y=39$$

 $3x+5y=31$.

6.
$$12x+15y=-18$$

 $18x-7y=-86$.

7.
$$2x+y-3=0$$

 $y-3x-1=0$

8.
$$y=4x-7$$

 $16x-5y=25$

9.
$$6x = 7y + 7$$

 $7y - x = 8$

10.
$$3x-4y=20$$

 $x+2y=5$.

Example 6. Solve

$$3x+y=17$$

 $8x+11y=37$

Solution.

$$3x+y=17$$
 ...(1)
 $8x+11y=37$...(2)

From equation (1), we have

$$y = 17 - 3x$$

From equation (2), we have

$$11y = 37 - 8x$$

$$y = \frac{37 - 8x}{11}$$

Equating these values of y, we get

$$17 - 3x = \frac{37 - 8x}{11}$$

$$187 - 33x = 37 - 8x$$
$$-33x + 8x = 37 - 187$$

OL

٠.

$$-33x + 8x = 37 - 187$$

 $-25x = -150$

$$x=6$$

OT

Substituting the value of x in equation (1), we have

$$3 \times 6 + y = 17$$

$$18+y=17$$

$$y = 17 - 18$$

$$y = -1$$

Hence the solution is x=6, y=-1.

This method of comparison consists of the following steps:

- (1) Express the same variable in terms of the other in both the equations.
- (2) Equate the results and obtain a simple equation containing only one variable.

- (3) Solve it and find the value of the variable.
- (4) Substitute the value of this variable in one of the equations and find the value of the other variable.

EXERCISE 1 (e)

(Section A)

Solve the following systems of equations:

$$1. \quad x-y=0$$

3.

$$2x-y=-1$$

$$3x+y=18$$
$$3x-4y=3$$

2.
$$3x-y=2$$

$$x+2y=3$$

4.
$$5x+y=11$$

 $x+5y=7$

(Section B)

Solve each of the following systems of equations:

5.
$$7x+4y=5$$

$$5x + 6y = 2$$

7.
$$5x-15y=22$$

 $7x+10y=37$

9.
$$6x - 5y = 21$$

$$5x+4y=17\frac{1}{2}$$

6.
$$x-y+1=0$$

 $2x+2y+3=0$

8.
$$11x+15y+23=0$$

 $7x-2y=20$

10.
$$5x+4y+8.7=0$$

$$3x+y+4\cdot 1=0$$

Example 7. Solve the following equations:

$$\frac{x}{2} + y = 0.8$$

$$\frac{7}{x+\frac{y}{2}}=10.$$

Solution. The given equations are

[C.B.S.E., 1984 (A.I.)]

$$\frac{x}{2} + y = 0.8$$

$$x+2y=1.6$$

$$\frac{7}{x + \frac{y}{2}} = 10$$

or
$$7 = 10x + 5y$$

or
$$10x + 5y = 7$$

Multiplying equation (1) by 10, we get

$$10x + 20y = 16$$

...(2)

Subtracting (2) from (3), we get

$$15y = 9$$

$$\therefore y = \frac{3}{5}$$

Substituting the value of y in equation (1), we get

$$x+2\times\frac{3}{5}=\frac{8}{5}$$

$$x = \frac{8}{5} - \frac{6}{5}$$

$$\therefore x = \frac{2}{5}$$

Hence

$$x = \frac{2}{5}$$

$$y = \frac{3}{5}$$

Example 8. Solve:
$$\frac{5}{y} - \frac{2}{x} = 1\frac{1}{6}$$

 $\frac{36}{x} - \frac{24}{y} = 1$

Solution. The given equations are

$$\frac{-2}{x} + \frac{5}{y} = \frac{7}{6}$$
 .. (1)

$$\frac{36}{x} - \frac{24}{y} = 1$$
 ...(2)

Multiplying both sides of equation (1) by 18, we get

$$\frac{-36}{x} + \frac{90}{y} = 21$$
 ...(3)

Adding equations (2) and (3), we get

$$\frac{\frac{66}{y}}{\frac{1}{y}} = \frac{22}{66} \quad \text{or} \quad \frac{1}{y} = \frac{1}{3}$$

$$y = 3$$

Substituting the value of y in equation (1), we get

or
$$\frac{-2}{x} + \frac{5}{3} = \frac{7}{6}$$

or $\frac{-2}{x} = \frac{7}{6} - \frac{5}{3}$ or $\frac{-2}{x} = -\frac{3}{6}$
or $\frac{-2}{x} = \frac{-1}{2}$ $\therefore x = 4$

Hence x=4, y=3

OF

Example 9. Solve: 10x+3y=30xy 5x-12y=7xy

Solution. The given equations are

$$10x + 3y = 30xy$$
$$5x - 12y = 7xy$$

These equations are *not* linear in x and y, but we can convert them into linear equations. However, we will put them in the form of equations of Example 8, worked out above.

Dividing both equations by x and y, we get

$$\frac{10}{y} + \frac{3}{x} = 30$$

$$\frac{5}{y} - \frac{12}{x} = 7$$

Solve these equations, as solved in worked out Example 8.

Observe that equations (1) and (2) are not linear in x and y. But these can be converted into linear equation by an appropriate substitution $e \cdot g$, by putting u for $\frac{1}{x}$ and v for $\frac{1}{y}$. Then equations become

$$3u+10v=30$$
, $-12u+5v=7$.

EXERCISE 1(f)

(Section A)

Solve the following equations algebraically:

1.
$$2x+3y=6$$

$$x - \frac{5}{4}y = 1$$
.

2.
$$5x+4y=8.7$$

$$3x + y = 4.1$$
.

3.
$$3a-2b=8$$

$$\frac{a}{3} + \frac{b}{2} = \frac{5}{4}$$

4.
$$5x+2y=11$$

$$\frac{x}{4} - \frac{y}{3} = 1\frac{5}{12}$$

(Section B)

$$5 \frac{x}{2} + \frac{y}{4} = 6$$

$$\frac{x}{5} - \frac{y}{2} = 0.$$

6.
$$4x + \frac{6}{y} = 15$$

$$6x - \frac{8}{v} = 14.$$

7.
$$\frac{3}{x} - 4y = 10$$

$$\frac{4}{x}$$
 + 3y = 5. [C.B.S.E., 1984 (Delhi)]

8.
$$\frac{4}{x} + 5y = 7$$
.

 $\frac{3}{x} + 4y = 5$.

(Section C)

9.
$$\frac{1}{7x} + \frac{1}{6y} = 3$$

$$\frac{1}{2x} - \frac{1}{3y} = 5.$$

11.
$$\frac{x-1}{y+1} = \frac{3}{4}$$

$$\frac{x+2}{y-2} = \frac{4}{3}$$

13.
$$5x+4y=31xy$$

$$3y-2x=6xy$$
.

10.
$$x-y=0.9$$

$$\frac{11}{2(x+y)} = 1.$$

12.
$$\frac{7+x}{5} - \frac{2x-y}{4} = 3y-5$$

$$\frac{5y-7}{2} + \frac{4x-3}{6} = 18-5x$$
.

14.
$$\frac{x+y}{xy} = 2$$

$$\frac{x-y}{xy}=6.$$

1'4. GENERAL SOLUTION AND CONDITIONS FOR SOLVABILITY

Let us solve the general system of two simultaneous linear equations given below:

$$a_1x + b_1y + c_1 = 0$$

...(2)

...(3)

$$a_2x + b_2y + c_2 = 0$$

We eliminate y by using one of the methods discussed in the last Article 1'3.

Multiplying both sides of (1) by b_2 and of (2) by b_1 , we get

$$a_1b_2x + b_1b_2y + b_2c_1 = 0$$

$$a_{1}b_{1}x + b_{1}b_{2}y + b_{1}c_{2} = 0$$
 ...(4)

Subtracting (4) from (3), we get

$$(a_1b_2-a_2b_1)x+b_2c_1-b_1c_2=0$$

Then
$$(a_1b_2-a_2b_1)x=b_1c_2-b_2c_1$$
 ...(5)

Multiplying both sides of (1) by a_2 and of (2) by a_1 , we get

$$a_1 a_2 x + a_1 b_1 y + a_2 c_1 = 0$$
 ...(6)

$$a_1a_2x + a_1b_2y + a_1c_2 = 0$$
 ...(7)

Subtracting (7) from (6), we get

$$(a_2b_1-a_1b_2)y+a_2c_1-a_1c_2=0$$

Then $(a_2b_1-a_1b_2)y=a_1c_2-a_2c_1$

or
$$(a_1b_2-a_2b_1)y=c_1a_2-c_2a_1$$
 ...(8)

Now two cases arise: Either $a_1b_2-a_2b_1\neq 0$ or $a_1b_2-a_2b_1=0$

(i) If $a_1b_2-a_2b_1\neq 0$, then we get from (5) and (8),

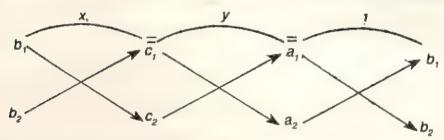

$$x = \frac{b_1 c_2 - b_2 c_1}{a_1 b_2 - a_2 b_1},$$
 $y = \frac{c_1 a_2 - c_2 a_1}{a_1 b_2 - a_2 b_1}.$

This forms the one and only solution of the given system. So, we conclude that if $a_1b_2-a_2b_1\neq 0$ i.e., $\frac{a_1}{a_2}\neq \frac{b_1}{b_2}$, the system has a unique solution which is generally written as

$$\frac{x}{b_1c_2 - b_2c_1} = \frac{y}{c_1a_2 - c_2a_1} = \frac{1}{a_1b_2 - a_2b_1}$$

This is known as method of cross multiplication.

The above solution can be written easily with the help of the following diagram:

Here the co-efficients are to be multiplied crosswise in the direction of arrows. Products formed by descending from left to right are positive, but those formed by descending from right to left are negative.

If $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$, the system of equations has a unique solution. Hence, the system of

equations is consistent, when $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$.

(ii) If
$$a_1b_2-a_1b_1=0$$
, then $\frac{a_1}{a_2}=\frac{b_1}{b_2}$. Let us suppose that $\frac{a_1}{a_2}=\frac{b_1}{b_2}=k$.

Thus $a_1 = ka_2$ and $b_1 = kb_2$.

So, the given equations become

$$ka_2x + kb_2y + c_1 = 0$$

$$a_2x + b_2y + c_2 = 0$$

These equations can both be satisfied simultaneously only if $c_1=kc_2$. If $c_1=kc_2$, any solution of $a_2x+b_2y+c_2=0$ will satisfy $a_1x+b_1y+c_1=0$ and any solution of $a_1x+b_1y+c_1=0$ will satisfy $a_2x+b_2y+c_2=0$. It follows that there are infinitely many solutions of the system, if $\frac{a_1}{a_2}=\frac{b_1}{b_2}=k$ and $c_1=kc_2$. Thus, if $\frac{a_1}{a_2}=\frac{b_1}{b_2}=k$ and $\frac{c_1}{c_2}=k$ i.e., $\frac{a_1}{a_2}=\frac{b_1}{b_2}=\frac{c_1}{c_2}$, the system of equations is dependent.

If $\frac{a_1}{a_2} = \frac{b_1}{b_2}$ and $c_1 \neq kc_2$, there is no solutions of the system. Thus, if $\frac{a_1}{a_2} = \frac{b_1}{b_2}$ and $\frac{c_1}{c_2} \neq k$ i.e., $\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$, the system of equations is **inconsistent**.

Example 10. Find out if the following systems of equations are consistent, inconsistent or dependent.

(a)
$$3x = y + 8$$
 (b) $2x + y = 4$ (c) $x - 2y = 1$ $9x - 3y = 12$ $3x + y + 3 = 0$ $3x - 3 = 6y$

Solution. First we write the equations of the system in the general form.

(a) Given equations are
$$3x=y+8$$

 $9x-3y=12$

These equations can be written as

$$3x - y - 8 = 0$$

$$9x - 3y - 12 = 0$$
Here
$$\frac{a_1}{a_2} = \frac{3}{9} i.e., \frac{1}{3}, \frac{b_1}{b_2} = \frac{-1}{-3} i.e., \frac{1}{3}, \frac{c_1}{c_2} = \frac{-8}{-12} i.e., \frac{2}{3}$$

$$\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}.$$

Hence the system of equations is inconsistent.

(b) Given equations are
$$2x+y=4$$
$$3x+y+3=0$$

These equations can be written as 2x+v-4=0

Неге

$$3x+y+3=0$$

$$\frac{a_1}{a_2} = \frac{2}{3}, \quad \frac{b_1}{b_2} = 1 \text{ and } \frac{c_1}{c_2} = \frac{-4}{3}$$

$$\frac{a_1}{a_2} \neq \frac{b_1}{b_2}.$$

Hence the system of equations is consistent.

(c) Given equations are
$$x-2y=1$$

 $3x-3=6y$

These equations can be written as

$$x-2y-1=0$$

$$3x-6y-3=0$$
Here
$$\frac{a_1}{a_2} = \frac{1}{3}, \quad \frac{b_1}{b_2} = \frac{-2}{-6} \text{ i.e., } \frac{1}{3} \text{ and } \frac{c_1}{c_2} = \frac{-1}{-3} \text{ i.e., } \frac{1}{3}$$

$$\vdots \qquad \frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

Hence the system of equations is dependent.

Example 11. Find the value of k for which the system

$$3x+ky=8$$
$$2x-v+5=0$$

will have (a) a unique solution (b) no solutions.

Solution. The given equations are

3x + ky - 8 = 0

$$2x - y + 5 = 0$$

Неге

$$\frac{a_1}{a_2} = \frac{3}{2}$$
, $\frac{b_1}{b_3} = \frac{k}{-1}$ and $\frac{c_1}{c_2} = \frac{-8}{5}$

(a) The system has a unique solution, if $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$

i.e.,
$$\frac{3}{2} \neq \frac{k}{-1}$$
 or $k \neq -\frac{3}{2}$

(b) The system has no solution, if $\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$

i.e.,
$$\frac{3}{2} = \frac{k}{-1}$$
 or $k = -\frac{3}{2}$.

EXERCISE 1 (g)

(Section A)

Determine whether the following systems of equations are consistent, inconsistent or dependent:

(a)
$$3x - y = 2$$

 $6x - 2y = 3$

(b)
$$4y = 3x + 23$$

 $4x = 11 - 3y$

(c)
$$2x+3y-6=0$$

 $6x+9y-18=0$

(d)
$$4x-y=7$$

 $12x-21=3y$

In each of the following systems of equations determine whether the system has a unique solution, no solutions or infinitely many solutions:

(a)
$$x + y = 3$$

$$2x+3y=8$$

(b)
$$x + y = 5$$

(c)
$$x-2y+5=0$$

$$3x - 6y + 12 = 0$$

$$3x + 3y = 15$$

$$(d) 3x = 2 + y$$

$$2y = 3 - x$$

(Section B)

Find the values of k for which the system of equations

$$2x + ky = 1$$

3x - 5y = 7

has (a) a unique solution, (b) no solutions.

Find the values of k for which the system of equations

$$kx + 2y - 5 = 0$$

$$y + 3x = 1$$

will have (a) a unique solution and (b) no solutions.

Example 12. Solve the following system of equations by the method of cross-multiplication:

$$8x = 7y + 19$$

 $10x = 23 + 9y$

Solution. The given equations are

$$8x = 7y + 19$$

 $10x = 23 + 9y$

Writing these equations in general form, we get

$$8x + (-7)y + (-19) = 0$$
$$10x + (-9)y + (-23) = 0$$

By the method of cross-multiplication, we have

$$\frac{x}{(-7)\times(-23)-(-9)\times(-19)} = \frac{y}{(-19)\times10-(-23)\times8} = \frac{1}{8\times(-9)-10\times(-7)}$$
or
$$\frac{x}{161-171} = \frac{y}{-190+184} = \frac{1}{-72+70}$$
or
$$\frac{x}{-10} = \frac{y}{-6} = \frac{1}{-2} i.e., \frac{x}{10} = \frac{y}{6} = \frac{1}{2}$$

$$\therefore x = \frac{10}{2} i.e., 5 \text{ and } y = \frac{6}{2} i.e., 3.$$

Note that the method of cross-multiplication can be used only when the given system is consistent i.e., has a unique solution. In general, first check that the system is consistent and then use the method of cross multiplication.

Example 13. Solve the following system of equations:

$$(a+c)x-(a-c)y=2ab$$

$$(a+b)x-(a-b)y=2ab$$

Solution. The given equations can be written as

$$(a+c)x-(a-c)y-2ab=0$$

 $(a+b)x-(a-b)y-2ab=0$

Here
$$\frac{a_1}{a_2} = \frac{a+c}{a+b}$$
 and $\frac{b_1}{b_2} = \frac{-(a-c)}{-(a-b)}$ i.e., $\frac{a-c}{a-b}$

So,
$$\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$$

Hence the given system is consistent.

By the method of cross-multiplication, we get

$$\frac{x}{-(a-c)\times(-2ab)-[-(a-b)]\times(-2ab)} = \frac{y}{(-2ab)(a+b)-(-2ab)(a+c)}$$

$$= \frac{1}{(a+c)\times[-(a-b)]-(a+b)\times[-(a-c)]}$$

$$\frac{x}{-2ab(-a+c+a-b)} = \frac{y}{-2ab(a+b-a-c)}$$

$$= \frac{1}{-a^2+ab-ca+bc+a^2-ca+ab-bc}$$

or

or
$$\frac{x}{-2ab(c-b)} = \frac{y}{-2ab(b-c)} = \frac{1}{2ab-2ca}$$
or
$$\frac{x}{2ab(b-c)} = \frac{y}{-2ab(b-c)} = \frac{1}{2a(b-c)}$$

$$\therefore \qquad x = \frac{2ab(b-c)}{2a(b-c)}, \quad y = \frac{-2ab(b-c)}{2a(b-c)}$$
i.e., $x=b$, $y=-b$

EXERCISE 1 (h)

(Section A)

Solve by the method of cross-multiplication:

1.
$$x+4y=14$$

 $7x-3y=5$
2. $x=2y+6$
 $y=2x-3$
3. $13x+7y+114=0$
 $26x-10y+60=0$
4. $3x=4y+20$
 $x+2y=5$

(Section B)

Solve the following systems of equations:

5.
$$\frac{x}{3} + \frac{y}{2} = 3$$
6. $\frac{x}{4} + \frac{y}{3} = 6$

$$x - 2y = 2$$
7. $ax + by = a^2 + b^2$

$$ax - by = a^2 - b^2$$
8. $ax + by = 2ab$

$$x + y = a + b$$
9. $x = py + q$

$$y = qx + p$$
10. $px + qy = r$

$$qx = py$$

(Section C)

Solve the following systems of equations:

11.
$$(a+b)x-(a-b)y=3ab$$

 $(a+b)y-(a-b)x=ab$
12. $(a+b)x+(a-b)y=2a$
 $(a-b)x+(a+b)y=2b$

1.5. WORD PROBLEMS

Many everyday problems can be easily solved by translating them into a system of equations. A few types of problems are given here.

The method of problem-solving consists of three steps:

- (1) Translating the word problem into symbolic language.
- (2) Solving the equations, and
- (3) Interpreting the solution of the equations.

by reversing the digits is 9 more than the original number. Find the number.

tens place. Let x represent the digit in the units place and y represent the digit in the

Then y+x=7The number is 10y+x. When we interchange the digits, x becomes the digit in the tens place and y the digit in the units place.

The new number =10x+y.

The problem states that

$$10x+y=10y+x+9$$

or
$$10x + y - 10y - x = 9$$

or
$$9x-9y=9$$
 or $x-y=1$

We thus have the system of equations:

$$x+y=7$$

$$x-y=1$$

Adding, we get

$$2x=8$$

or x=4

Substituting x=4 in x+y=7, we get

$$4+y=7$$
 or $y=3$.

Therefore, the required number = $10 \times 3 + 4$

=34.

Example 15. A fraction becomes 1 when 8 is added to its numerator. It becomes 1 when 1 is subtracted from its numerator and its denominator is multiplied by 2. Find the fraction.

Solution. Let the fraction be $\frac{x}{y}$.

When 8 is added to the numerator, the fraction becomes 1.

Then
$$\frac{x+8}{y} = 1$$
or
$$x+8=y$$
or
$$x-y=-8$$

When 1 is subtracted from the numerator and the denominator is multiplied by 2, the fraction becomes $\frac{1}{5}$.

Then
$$\frac{x-1}{2y} = \frac{1}{5}$$
or
$$5x-5=2y$$

or
$$5x-2y=5$$

We thus have the system of equations:

$$x-y=-8$$
 ...(1)

$$5x-2y=5$$
 ...(2)

Solving equations (1) and (2), we get

$$x=7, y=15.$$

Therefore, the required fraction = $\frac{7}{15}$.

Example 16. Three years hence a father will be three times as old as his son, 7 years ago he was seven times as old as the son. How old are they now?

Solution. Let the present age of the father be x years and of the son be y years.

After 3 years, the father's age will be (x+3) years.

After 3 years, the son's age will be (y+3) years.

Thus x+3=3(y+3)or x+3=3y+9or x-3y=6

7 years ago, the father's age was (x-7) years.

7 years ago, the son's age was (y-7) years.

Thus x-7=7(y-7) or x-7=7y-49 or x-7y=-42

We thus have the following system of equations:

x-3y=6 and x-7y=-42

Solving these equations, we get x=42. y=12

x=42, y=12

Father's age=42 years, Son's age=12 years.

EXERCISE 1(i)

Number Problems

- 1. The sum of two numbers is 45 and their difference is 15. Find the numbers.
- 2. Find two numbers, which differ by 7, such that twice the greater added to five times the smaller makes 42.
- 3. Find two numbers such that twice the first added to the second makes 21, and twice the second added to the first makes 27.
- 4. Find two numbers such that four times the first added to three times the second is 93 and the excess of three times the first over twice the second is 6.
- 5. If I add 1 to each of the two given numbers, their ratio is 1:2. If I subtract 5 from each the ratio is 5:11. Find the numbers.

Digit Problems

- 6. A number of two digits is four times the sum of its digits. If 9 be added to the number, the digits in the number are reversed. Find the number.
- 7. A number of two digits is four times the sum of its digits and the number formed by reversing the digits is 27 more than the original number. Find the number.
- 8. The sum of the digits of a two-digit number is 7. If the digits are reversed, the new number increased by 3 equals four times the original number. Find the original
- The units digit of a two digit number is twice the difference of its digits. If the order of the digits is reversed the number is increased by 18. Find the number.
- 10. In a two-digit number, the sum of the digits is 13. If the number is subtracted from the one obtained by interchanging the digits, the result is 45. Find the original number.

 [C.B.S.E., 1978 (Delhi)]
- 11. A number consists of two digits, and the tens digit is 2/3 of the units digit. If the digits are reversed the number is increased by 27. Find the number.
- The result of dividing a number of two digits by the number with the digits reversed is 18. If the sum of the digits is 12, find the number.

Fraction Problems

- 13. When the numerator of a fraction is increased by 4, the fraction increases by ²/₃. What is the denominator of the fraction?
 14. A fraction becomes 2 when 2 increased by 4, the fraction increases by ²/₃. What [C.B S E., 1978 (A.I.)]
- 14. A fraction becomes 2 when 9 is added to its numerator and it becomes 1 when 2 is subtracted from its denominator. Find the fraction.

- 15. Find the fraction which becomes $\frac{1}{2}$ when the denominator is increased by 4 and equals $\frac{1}{3}$ when the numerator is diminished by 5.
- 16. If 1 is added to the denominator of a fraction, the fraction becomes \(\frac{1}{2}\). If 1 is added to the numerator of the fraction, the fraction becomes 1. Find the fraction.
- 17. A fraction becomes equal to \(\frac{1}{2} \) when 1 is subtracted from its numerator and it becomes equal to \(\frac{1}{2} \) when 8 is added to its denominator. Find the fraction.
- 18. Find the fraction which becomes $\frac{2}{3}$ when numerator and denominator are increased by 1 and $\frac{1}{2}$ when numerator and denominator are diminished by 1.
- 19. If the numerator of a fraction is increased by 2 and the denominator by 1, it becomes equal to $\frac{5}{3}$, and if the numerator and the denominator of the same fraction are each increased by 1, the fraction becomes equal to $\frac{1}{2}$. Find the fraction.

Age Problems

- 20. Six years ago Jai Ram was three times as old as his son. In six years time, he will be twice as old as his son. Find their present ages.
- 21. Five years hence the age of a man will be 3 times that of his son. Five years ago, the father's age was 7 times that of his son. What are their ages now?
- 22. Ten years ago, father was twelve times as old as his son and ten years hence he will be twice as old as his son will be. Find their present ages.

 [C.B.S.E., 1981 (A.I.)]
- 23. Eight years ago Ravi's age was \(\frac{3}{4}\) of Pramod's. Four years hence Ravi's age will be \(\frac{6}{7}\) of Pramod's. Find their present ages.
- 24. Three times my father's age added to seven times my sister's age is 183 years. Six times the difference between their ages added to 9 is three times the sum of their ages. Find their ages.

Miscellaneous Problems

- 25. Mohan Lal sold 9 bags and 6 pens for Rs. 90. Again he sold 8 bags and 5 pens at the same rate for Rs. 77. Find the price of one bag and one pen.
- 26. 3 nuts and 6 bolts weigh 72 g, 4 nuts and 5 bolts weigh 66 g. Find the weight of a nut and a bolt.
- 27. Prachi has 50 coins, some are 50 P coins and the rest 10 P coins. The total value of all the coins is Rs. 7.80. Find the number of each kind of coin.
- 28. In an examination, Manju's marks are 2 more than $\frac{2}{5}$ of Kavita's. If Manju scored 4 less she would have had $\frac{3}{8}$ of Kavita's. Find their marks.
- 29. A man buys postage stamps of denominations 3 paise and 5 paise for Re 1. He buys 22 stamps in all. Find the number of 3 paise stamps bought by him.
- 30. There were 2,500 persons who bought tickets to see a village fair. The adults paid 75 paise each for their admission tickets but the children paid only 25 paise each. If the total receipts amounted to Rs. 1,503, using an equation method, find how many adults and how many children saw the fair?
- 31. A boy saves his pocket money to buy a toy aeroplane. He finds that the cost of the toy is Rs. 50 less than his yearly pocket money. What is his monthly pocket money if he could buy the toy out of 3 months pocket money and Rs. 40 extra which he gets from his mother?

REVIEW EXERCISE I

(Section A)

- Fill in the blanks to make the following statements true: 1.
 - (a) An equation of the type ax+by+c=0, where a, b and c are real numbers and a, b are not simultaneously zero is called aequation. [C.B.S.E., 1980 (A.I.)]
 - (b) The graph of the equation x+y=10 is a......
 - (c) The graph of x=1 is a line parallel to.......axis.

[C.B.S.E., 1978 (Delhi)]

(d) The graph of y=1 is a line parallel to........axis.

[C.B.S.E., 1980 (A.I.)]

- (e) A system of linear equations is inconsistent if it has......solutions.
- (f) The method of cross-multiplication can be used only when the given system of linear equations is......
- If (5, k) is a solution of the equation 2x+y-7=0. Find the value of k. 2.
- Solve: y=2x-6, y=0.

(Section B)

Solve the following system of equations: 4.

$$11x - 8y = 27$$
,

$$3x + 5y = -7$$

[C.B.S.E., 1982 (Delhi)]

Solve for x and v:

$$9x + 4y = 29$$

 $x - y = 9$

Solve the simultaneous equations, algebraically

$$2x+y=6$$

$$3y = 8 + 4x$$

 $\frac{x}{4} - 3 = \frac{y}{6}$

$$\frac{1}{2}x-y=-2.$$

Solve graphically the simultaneous equations:

$$x+y=7$$
,

$$2x - 3y = 9$$
.

[C.B.S.E., 1978 (A.I.)]

Sketch the graphs of the equations: 9.

$$2x+3y=6$$
 and

$$6x - 5y = 4$$

Indicate in the graph the solution set of the above equations.

[C.B.S.E., 1979 (Delhi)]

10. Solve:

$$\frac{7}{x} + \frac{8}{v} = 2$$

$$\frac{7}{x} + \frac{8}{y} = 2$$
, $\frac{2}{x} + \frac{12}{y} = 20$.

- 11. A lady has only 10 paise and 25 paise coins in her purse. If in all she has 60 coins totalling Re 8:25 have paise and 25 paise coins in her purse. totalling Rs. 8.25, how many of each does she have? [C.B.S.E., 1980 (A.I.)]
- The total cost of 8 buckets and 5 mugs is Rs. 92 and the total cost of 5 buckets and 8 12. mugs is Rs. 77. Find the cost of 2 mugs and 3 buckets.
- The sum of the digits of a two-digit number is 9. If the digits are reversed, the number 13. obtained is 45 more than the original number. Find the original number.
- The sum of the numerator and denominator of a fraction equals 7. Four times the 14. [C.B.S.E., 1984 (A.I.)]numerator is 8 less than 5 times the denominator. What is the fraction?
- In a shooting competition a markman receives 50 paise if he hits the mark and pays 20 15. paise if he misses it. He tried 60 shots and was paid Rs. 1.30. How many times did

16. Solve the following system of equations:

$$\frac{1}{7x} + \frac{1}{6y} = 3,$$
 $\frac{1}{2x} - \frac{1}{3y} = 5$

- 17. The present age of a father is 3 years more than three times the age of the son. Three years hence, father's age will be 10 years more than twice the age of the son. Find their present ages.

 [C.B.S.E., 1982 (Delhi)]
- 18. There are two examination rooms A and B. If 10 candidates are sent from A to B, the number of students in each room is the same. If 20 students are sent from B to A, the number of students in A is double the number of students in each room.

[C.B.S.E., 1984 (A.I.)]

- 19. A and B, each has a certain number of mangoes. A says to B, "if you give me 30 of your mangoes, I will have twice as many as left with you." B replies, "if you give me 10, I will have thrice as many as left with you." How many mangoes does each have?

 [C.B.S.E., 1983 (A.I.)]
- 20. A sailor goes 8 km downstream in 40 minutes and returns in 1 hour. Determine the speed of the sailor in still water and the speed of the current. [C.B.S.E., 1977 (Delhi)]

QUADRATIC EQUATIONS

2.1. QUADRATIC POLYNOMIALS

You have already studied quadratic polynomials in one variable.

Consider the following quadratic polynomials:

(i) x^2-4

(ii) $25x^2-9$

(iii) $x^2 - 5x + 6$

(iv) $6x^2 - x - 2$.

Note that all the co-efficients in each of the above polynomials are real numbers. The general form of a quadratic polynomial is ax^2+bx+c , where a, b, c are real numbers, $a\neq 0$ and x is a variable. Throughout this chapter we will consider x to be a real variable. So, in a quadratic polynomial x can take any real value.

2.2. ZEROS OF A QUADRATIC POLYNOMIAL

Every quadratic polynomial in x has a real value for every real value of x.

Let us consider the quadratic polynomial $p(x)=3x^2+2x-1$. If we substitute a real value of x, say x=0, the value of p(x) is -1. If we take x=1, the value of p(x) is 4 and so on.

Can you find those values of x for which p(x)=0?

If we substitute x=-1, the value of p(x) is 3-2-1 i.e., zero.

If we substitute $x=\frac{1}{3}$, the value of p(x) is $3\times\frac{1}{9}+2\times\frac{1}{3}-1$ or $\frac{1}{3}+\frac{2}{3}-1$ i.e., zero.

Thus, there are two values of x i.e., x=-1 and $x=\frac{1}{3}$ for which the value of polynomial becomes zero. These two values of x are called the zeros of the quadratic polynomial $3x^2+2x-1$.

If k is a real number and the value of a quadratic polynomial ax^2+bx+c becomes zero for x=k, then the real number k is called a zero of the quadratic polynomial ax^2+bx+c .

Every quadratic polynomial can have at most two zeros. This fact cannot be proved here, since the proof is beyond the scope of the book.

Consider the quadratic polynomial x^2+2 . There is no real value of x which makes quadratic polynomials do not have any real zero. Thus, some

If we are given a quadratic polynomial, we can test whether any given real number k is a zero of the given polynomial or not by substitution.

If we are given a quadratic polynomial, how do we determine its zeros?

Last year you solved linear equations in one variable i.e., ax+b=0, $a\neq 0$. This really amounts to finding zeros of the linear polynomial ax+b. Similarly, for finding zeros of a quadratic polynomial ax^2+bx+c , $a\neq 0$, we have to solve $ax^2+bx+c=0$ which is called quadratic equation.

The following are all quadratic equations:

$$x^{3}-4=0$$
 $25x^{2}-9=0$ $x^{2}-5x+6=0$ $6x^{2}-x-2=0$

A quadratic equation in one variable is an equation in one variable which equates to zero a polynomial of degree two.

Every quadratic equation can, therefore, be written in the form

$$ax^2+bx+c=0,$$
 $a\neq 0$

where the coefficients a, b, c may belong to any of the number systems at our disposal.

Thus the general quadratic equation is

 $ax^2+bx+c=0$, where $a, b, c, \in \mathbb{R}$ and $a\neq 0$.

If the real numbers α and β are two zeros of a quadratic polynomial ax^2+bx+c , $a\neq 0$, we say that α and β are the two **roots** of the quadratic equation $ax^2+bx+c=0$, $a\neq 0$.

Example 1. Show that $\frac{1}{2}$ is a zero of the polynomial $2x^2+7x-4$.

Solution. Let $p(x)=2x^3+7x-4$

The value of
$$p(x)$$
 for $x = \frac{1}{2}$ is $2\left(\frac{1}{2}\right)^{11} + 7 \times \frac{1}{2} - 4$

$$= 2 \times \frac{1}{4} + \frac{7}{2} - 4$$

$$= \frac{1}{2} + \frac{7}{2} - 4$$

$$= 4 - 4$$

$$= 0$$

Thus, the value of p(x) for $x=\frac{1}{2}$ is zero.

Hence $\frac{1}{2}$ is a zero of the polynomial $2x^2+7x-4$.

Example 2. For the quadratic equation $2x^2-5x-3=0$, determine which of the following are solutions?

(a)
$$x = 3$$

(b)
$$x = -1$$

(c)
$$x = -\frac{1}{2}$$
.

Solution. The given equation is $2x^2 - 5x - 3 = 0$.

(a) Substituting x=3 in the L.H.S. of the equation we get

$$2 \times 3^2 - 5 \times 3 - 3 = 18 - 15 - 3 = 0$$

L.H.S.=R.H.S. for x=3.

Hence x=3 is a solution of the given quadratic equation.

(b) Substituting x=-1 in the L.H.S. of the equation, we get

$$2 \times (-1)^2 - 5(-1) - 3 = 2 + 5 - 3 = 4$$

Hence x=-1 is not a solution of the given equation.

(c) Substituting $x=-\frac{1}{2}$ in the L.H.S. of the equation, we get

$$2 \times \left(-\frac{1}{2}\right)^{3} - 5\left(-\frac{1}{2}\right) - 3 = 2 \times \frac{1}{4} + \frac{5}{2} - 3$$
$$= \frac{1}{2} + \frac{5}{2} - 3 = 0$$

$$\therefore$$
 L.H.S.=R.H.S. for $x=-\frac{1}{2}$.

Hence $x=-\frac{1}{2}$ is a solution of the given equation.

EXERCISE 2 (a)

(Section A)

1. Which of the following are quadratic equations?

(a) $x^3-5x+6=0$

(b) $2x^2 + 7x = 0$

(c) $2x^2 + 3x = 2$

(d) $6x^2+1=5x$

(e) $x^3+x^2-x+1=0$

(f) $x^3+4=2x^3$

(g) $3x^2-4x+2=2x^2-2x+4$

- 2. Show that -2 is a zero of the polynomial $3x^2+11x+10$.
- 3. Show that 2 is not a zero of the polynomial $x^2-7x+14$.

(Section B)

- 4. Which of the numbers 2, 3 and -4 are the zeros of the polynomial $2x^2+7x-4$?
- 5. Which of the numbers $\frac{2}{3}$, 1 and $\frac{3}{2}$ are the zeros of the polynomial $6x^2-13x+6$?
- 6. For the quadratic equation $2x^2+3x-2=0$, determine which of the following are solutions?

(a) x = -2

(b) x = 0

(c) $x = \frac{1}{6}$.

7. For the quadratic equation $6x^2-x-15=0$, determine which of the following are solu-

(a) $x = \frac{3}{5}$

(b) $x = \frac{5}{3}$ (c) $x = -\frac{3}{2}$.

SOLVING A QUADRATIC EQUATION BY FACTORIZATION

If a and b are any two real numbers such that ab=0, then either a=0 or b=0 or both a=0 and b=0.

Given a quadratic equation, if we can factorise the quadratic polynomial into two linear factors, we can set each factor equal to zero and obtain a solution.

Example 3. Solve $x^2=49$, $x \in R$.

Solution.

$$x^2 = 49$$

or

 $x^2 - 49 = 0$

Factorise the quadratic polynomial

or

$$(x+7)(x-7)=0$$

 x^2-49 , $[x^2-a^2=(x+a)(x-a)]$

then

$$x+7=0$$
 or $x-7=0$

x=-7 or x=7

Thus, the two solutions of the given quadratic equation are -7 and 7.

Example 4. Solve $2x^2-5x=0$, when $x \in R$.

Solution.

$$2x^2 - 5x = 0$$

OT

$$x(2x-5)=0$$

$$x=0$$
 or $2x-5=0$

i.e.,

$$x=0$$
 or $2x=5$

Then

$$x=0$$
 or $x=2.5$.

Hence, the two roots of the given quadratic equation are 0 and 2'5.

EXERCISE 2 (b)

(Section A)

Solve the following equations, the domain of the variable being the set of real numbers in each case:

1.
$$x^2-25=0$$
.

2.
$$16x^2-9=0$$
.

3.
$$5x^2 = 9 + x^2$$

4.
$$3x^2-48=0$$
.
7. $x^2-3x=0$.

5.
$$(x-2)^2-16=0$$
,
8. $5x^2-9x=0$.

6.
$$5(x-3)^3 = 180$$
.
9. $16x^3 - 24x = 0$.

10.
$$2x^2-3ax=0$$
.

11.
$$3x^2 = 15x$$
.

12.
$$4x^2+9x=0$$
.

(Section B)

Find the roots of the following quadratic equations using factorization:

13.
$$(x-3)^2=4(x-3)$$
.

14.
$$(x+5)(x-5)=39$$

15.
$$(2x-3)(x-1)=12-5x$$
.

16.
$$\frac{1}{5}(x^2-1)+\frac{1}{3}(1-2x^2)=x^2$$

17.
$$(6+x)(5-x)+(5+x)(6-x)=10$$
.

Example 5. Solve $x^2 - 8x + 15 = 0$. when $x \in R$.

Solution.
$$x^2-8x+15=0$$

or $x^2-5x-3x+15=0$
or $x(x-5)-3(x-5)=0$
or $(x-5)(x-3)=0$

$$\begin{array}{c}
15 = (-5)(-3) \\
(-5) + (-3) = -8
\end{array}$$

Then x=5ОГ x=3

Hence the two roots of the given quadratic equation are 3 and 5.

Check:

When

$$\begin{array}{c}
 x = 5 \\
 5^2 - 8 \times 5 + 15 = 0 \\
 25 - 40 + 15 = 0 \\
 40 - 40 = 0 \\
 0 = 0
 \end{array}$$

When
$$x=3$$

 $3^2-8\times3+15=0$
 $9-24+15=0$
 $24-24=0$
 $0=0$

Example 6. Solve $9x^2 + 15x - 14 = 0$, $x \in R$.

Solution.
$$9x^3+15x-14=0$$

or $9x^3+21x-6x-14=0$
or $3x(3x+7)-2(3x+7)=0$
or $(3x+7)(3x-2)=0$

$$9 \times (-14) = -126$$

 $-126 = 21 \times (-6)$
 $21 + (-6) = 15$

:.
$$3x+7=0$$
 or $3x-2=0$
Then $x=-\frac{7}{3}$ or $x=\frac{2}{3}$

Thus, the two roots are $\frac{2}{3}$ and $-\frac{7}{3}$.

(Perform a check).

EXERCISE 2 (c)

Solve the following equations, when $x \in R$ in each case:

(Section A)

1.
$$x^2 + 6x - 16 = 0$$

2.
$$x^2-7x+12=0$$

3.
$$x^2+8x+15=0$$

4.
$$x^4 - 4x - 5 = 0$$
.

(Section B)

5.
$$4x^2+4x-35=0$$

6.
$$3x^2+11x+10=0$$

7.
$$6x^2+x-15=0$$

8.
$$12x^2-x-6=0$$

9.
$$3x^2+13x-10=0$$

10.
$$3x^2-10x=8$$
.

(Section C)

11.
$$(x+3)(5x+1)=3(x-1)$$

12.
$$2(2x+1)(x-1)=(2x-3)(4x-1)$$
.

2.4. SOLVING A QUADRATIC EQUATION BY COMPLETION OF SQUARES

Sometimes the polynomial of the given quadratic equation cannot be factorised by the method of splitting the middle term. Then we factorise it by the method of completing the

The method is illustrated by the following example:

Example 7. Solve $x^2+6x+2=0$, $x \in \mathbb{R}$.

Solution. We cannot break up 2 into factors whose sum is 6. So the polynomial $x^2 + 6x + 2$ cannot be factorised.

or
$$x^2+6x+2=0$$

or $x^2+6x=-2$
or $x^2+2.3.x+3^2=-2+3^2$
or $(x+3)^2=7$
or $x+3=\pm\sqrt{7}$
or $x=-3\pm\sqrt{7}$
Hence the two roots are $-3+7$ and $-3-\sqrt{7}$.

EXERCISE 2 (d)

(Section A)

Solve the following quadratic equations by completing the squares, the domain of the variable being R:

1.
$$x^2-2x-1=0$$
.

2.
$$x^2+3x+1=0$$
.

3.
$$x^2 + x = 7$$
.

4.
$$x^2-6x-65=0$$
.

5.
$$x^2+3x+1=0$$
.

6.
$$3x^2-4x-60=0$$
.

(Section B)

Solve the following equations, giving your answer correct to two decimal places:

7.
$$2x^2 - 8x + 5 = 0$$
.

8.
$$2x^2-3x-7=0$$
.

9.
$$3x^2-7x+1=0$$
.

10.
$$x^2-7x-5=0$$
.

11.
$$4x^2-11x=2$$
.

12.
$$3x^2-5x-4=0$$
.

2.5. ROOTS OF A QUADRATIC EQUATION AND THEIR NATURE

Let the quadratic equation be

$$ax^2+bx+c=0, a\neq 0$$

...(1)

Multiplying both sides by 4a, we get

$$4a^2x^2 + 4abx + 4ac = 0$$

...(2)

a is a root of equation (1), if it is a root of equation (2) and vice versa.

So, it is enough to solve equation (2) which can be re-written as

$$(2ax)^2 + 2(2ax)(b) = -4ac$$

or
$$(2ax)^2 + 2(2ax)(b) + (b)^2 = b^2 - 4ac$$

...(3)

 $(2ax+b)^2=b^2-4ac$ Since α is a root of equation (2), it is also a root of equation (3). When we substitute x=a on the L.H.S. of equation (3), then it becomes the square of a real number.

∴ L.H.S. ≥ 0

Hence R.H.S. > 0 i.e., $b^2-4ac > 0$.

What do you observe?

If the quadratic equation : $ax^2+bx+c=0$ has a real root, then b^2-4ac must be ≥ 0 .

If $b^2-4ac \ge 0$, then $\sqrt{b^2-4ac}$ is a real number. Then equation (4) gives

$$2ax+b=\sqrt{b^2-4ac} \quad \text{or} \quad -\sqrt{b^2-4ac}$$

$$2ax=-b+\sqrt{b^2-4ac} \quad \text{or} \quad -b-\sqrt{b^2-4ac}$$

$$x=\frac{-b+\sqrt{b^2-4ac}}{2a} \quad \text{or} \quad \frac{-b-\sqrt{b^2-4ac}}{2a}$$

What do you infer?

OF

If $b^2-4ac \ge 0$, then the quadratic equation $ax^2+bx+c=0$ has two real roots given by

$$\alpha = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \qquad \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}.$$

The quantity b^2-4ac is called the **discriminant** of the quadratic equation $ax^2+bx+c=0$ and is denoted by D.

If $D=b^2-4ac$ is zero, then the roots

$$\alpha = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$$
 and $\beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$ are both equal to $-\frac{b}{2a}$. We, then

say that this is a repeated root.

If $D=b^2-4ac$ is < 0, then the R.H.S. of equation (3) is negative. So, the L.H.S. should also be negative. But no real number α can be found which will make the L.H.S. of equation (3) negative by substituting $x=\alpha$ on it.

What do you observe?

If D < 0, then the quadratic equation $ax^2+bx+c=0$ has no real roots.

Let us summarize above discussions as under:

If $ax^2+bx+c=0$, $a\neq 0$, then $D=b^2-4ac$ is called the discriminant.

(1) If D > 0, then there are two distinct real roots given by

$$a = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \qquad \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

(2) If D=0, then there is a repeated real root given by

$$\alpha = -\frac{b}{2a}$$

(3) If D < 0, then there are no real roots.

Example 8. Determine whether the quadratic equation $6x^2-7x+2=0$ has real roots. If it has find them.

Solution. The given quadratic equation is

$$6x^2 - 7x + 2 = 0$$

Here we have a=6, b=-7 c=2

$$D=b^2-4ac=(-7)^3-4\times 6\times 2$$
=49-48 =1

D > 0. Hence the equation has two real roots.

These roots are given by

$$a = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \qquad \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

$$a = \frac{-(-7) + \sqrt{1}}{2 \times 6}, \qquad \beta = \frac{-(-7) - \sqrt{1}}{2 \times 6}$$

$$a = \frac{7 + 1}{12} \text{ or } \frac{2}{3}, \qquad \beta = \frac{7 - 1}{12} \text{ or } \frac{1}{2}$$

Then

Therefore, the two roots are \(\frac{2}{3} \) and \(\frac{1}{3} \).

Example 9. Find the value of k so that the equation $9x^2+3kx+4=0$ has a repeated root.

Solution. The given quadratic equation is

$$9x^2+3kx+4=0$$

 $a=9, b=3k, c$

Here, we have

e
$$a=9, b=3k, c=4$$

 $D=b^2-4ac=(3k)^2-4\times 9\times 4$
 $=9k^2-144$

Since the quadratic equation has a repeated root, its discriminant is zero i.e., D=0.

Then OF

$$9k^{2}-144=0$$

$$9k^2 - 144 = 0$$
 or $k^2 - 16 = 0$

 $k^2 = 16$. $k = \pm 4$.

EXERCISE 2 (e)

(Section A)

Write the discriminant of the following quadratic equations:

(a)
$$3x^2+2x-1=0$$

(b)
$$2x^2-5x+3=0$$

(c)
$$x^2 - \sqrt{3}x + 2 = 0$$

(d)
$$\sqrt{3}x^2-2\sqrt{2}x-2\sqrt{3}=0$$
.

Determine which of the following quadratic equations have real roots:

(a)
$$x^3-4x-2=0$$

(b)
$$2x^2-3x+1=0$$

(c)
$$3x^2-2\sqrt{2}x+1=0$$

(d)
$$4x^2+12x+9=0$$
.

Determine which of the following quadratic equations have no real roots:

(a)
$$x^2+4x+5=0$$

(b)
$$2x^2+3=6x$$

(c)
$$2x^2-3x+6=0$$

(d)
$$7x^2 - 8x = 5$$
.

(Section B)

- In the following determine the values of k for which the given quadratic equation has real roots:
 - (a) $kx^3 + 4x + 1 = 0$

(b)
$$x^2+4x+k=0$$

(c) $4x^2+2kx+9=0$

- (d) $2x^2-kx+3=0$.
- Show that each of the following quadratic equations has a repeated root and find that root:

(a)
$$2x^2-2\sqrt{2}x+1=0$$

(b)
$$3x^2+4\sqrt{3}x+4=0$$
.

In the following determine whether the given quadratic equations have real roots and if so find them:

(a)
$$5x^9-4x+2=0$$

(b)
$$2x^2+x-1=0$$

(c)
$$3x^2-5x+4=0$$

- (d) $6x^2-13x+6=0$.
- Show that the following quadratic equations have two real roots and find these roots:

(a)
$$2x^2-13x+20=0$$

(b)
$$\sqrt{7x^2-6x-13} \sqrt{7}=0$$
,

(Section C)

8. In the following, find the value of k so that the given quadratic equation has equal roots:

(a)
$$2x^2+kx+8=0$$

(b)
$$kx^2+8x=12$$
.

9. Show that the roots of $ax^2-2(a-b)x-4b=0$ are always real.

10. Determine the value of k such that the quadratic equation $x^2+7(3+2k)-2x(1+3k)=0$, has equal roots. [C.B.S.E., 1977 (Delhi)]

2.6. SUM AND PRODUCT OF ROOTS OF A QUADRATIC EQUATION

Let the quadratic equation be $ax^2+bx+c=0$, where $a\neq 0$.

Suppose its discriminant $D=b^2-4ac \ge 0$.

Then it has two real roots given by

$$a = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \qquad \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

 \therefore The sum of the roots= $\alpha+\beta$

$$= \frac{-b+\sqrt{b^2-4ac}}{2a} + \frac{-b-\sqrt{b^2-4ac}}{2a}$$

$$= \frac{-b+\sqrt{b^2-4ac}-b-\sqrt{b^2-4ac}}{2a}$$

$$= \frac{-2b}{2a} = -\frac{b}{a}.$$

The product of the roots = $a\beta$

$$= \left(\frac{-b + \sqrt{b^2 - 4ac}}{2a}\right) \left(\frac{-b - \sqrt{b^2 - 4ac}}{2a}\right)$$

$$= \frac{(-b)^8 - (\sqrt{b^2 - 4ac})^2}{4a^2}$$

$$= \frac{b^2 - (b^2 - 4ac)}{4a^2} = \frac{b^8 - b^2 + 4ac}{4a^2}$$

$$= \frac{4ac}{4a^2} = \frac{c}{a}$$

Thus, $\alpha + \beta = -\frac{\mathbf{b}}{\mathbf{a}}$ and $\alpha \beta = \frac{\mathbf{c}}{\mathbf{a}}$.

Example 10. Find the sum and product of the roots of the quadratic equation $4x^2-7x+5=0$.

Solution. The given quadratic equation is

$$4x^2 - 7x + 5 = 0$$

Here
$$a=4$$
, $b=-7$, $c=5$

Sum of the roots
$$=-\frac{b}{a}=-\frac{-7}{4}$$
 i.e., $\frac{7}{4}$

Product of the roots
$$=\frac{c}{a} = \frac{5}{4}$$
.

Example 11. Form a quadratic equation when sum of its roots is -3 and their product is 5.

Solution. Let the required quadratic equation be $ax^2+bx+c=0$.

Sum of the roots

$$= -\frac{b}{a} = -3 \qquad \text{(given)}$$

$$b=3a$$

Product of the roots

$$=\frac{c}{a}=5$$
 (given)

$$c=5a$$

Then, the quadratic equation becomes

$$ax^2 + 3ax + 5a = 0$$

Dividing both sides by a, we get

$$x^3 + 3x + 5 = 0$$

which is the required quadratic equation having sum of the root=-3 and product of the roots = 5.

The above equation can be rewritten as

$$x^2 - (-3)x + 5 = 0$$

$$x^2$$
—(sum of roots) x +(product of roots)=0.

What do you observe?

If sum of roots and product of roots are known, then a quadratic equation having these roots can be formed. Hence, if the roots are given separately, we can always find the quadratic equation corresponding to them.

Example 12. Find the quadratic equation whose roots are $1+\sqrt{5}$ and $1-\sqrt{5}$.

[C.B.S.E., 1979 (A.I.)]

Solution. Given roots are $1+\sqrt{5}$ and $1-\sqrt{5}$.

Sum of the roots

$$=1+\sqrt{5}+1-\sqrt{5}$$

Product of the roots

$$=(1+\sqrt{5})(1-\sqrt{5})$$

=1-5

The required quadratic equation is

 x^2 —(sum of the roots) x+(product of the roots)=0

or

$$x^{g}-(2)x+(-4)=0$$

i.e.,

$$x^2-2x-4=0$$
.

EXERCISE 2 (f)

(Section A)

Find the sum and product of the roots of the following quadratic equations:

1. $x^2-2x+1=0$.

2.
$$x^3+3x-5=0$$
.

3. $4x^2 + 5x - 2 = 0$.

4.
$$3x^2-4x+1=0$$
.

5.
$$x^2 + px + q = 0$$
.

6.
$$px-qx+r=0$$
.

(Section B)

Construct a quadratic equation whose roots have the sum and the product as under;

7. sum=2, product=2.

8. sum=4, product=5.

9. sum=-3, product=4.

10. sum = $-\frac{1}{6}$, product = $-\frac{1}{3}$.

Construct a quadratic equation whose roots are

11.
$$-2$$
 and 5 12. $-\frac{1}{2}$ and $-\frac{3}{2}$

13.
$$5+\sqrt{3}$$
 and $5-\sqrt{3}$
14. $\frac{2+\sqrt{5}}{3}$ and $\frac{2-\sqrt{5}}{3}$

15. Find the quadratic equation whose roots are $2\sqrt{3}$, $-2\sqrt{3}$.

[C.B.S.E., 1980 (A.I.)]

(Section C)

- 16. If one of the roots of the quadratic equation $2x^2+px+4=0$ is 2, find the other root.
- 17. One root of the quadratic equation 2x²-5x+k=0 is 3. Find the value of k and also the other root.
 18. Find the value of k are that it is a second of the root.
- 18. Find the value of k so that the sum of the roots of the equation $3x^2+(2k+1)$ x-k-5=0 is equal to the product of the roots.

2.7. SYMMETRIC FUNCTIONS OF ROOTS

Consider the following expressions involving a and β , the roots of a quadratic equation $ax^3+bx+c=0$.

$$a+\beta$$
, $a^2+\beta^2$, $a^3+\beta^3$, $a^2+\alpha\beta+\beta^3$, $\frac{\alpha}{\beta}+\frac{\beta}{\alpha}$

In each case interchange α and β and compare the new form with the original one. Are they different?

All these expressions are symmetric in a and β .

An expression involving α and β , the roots of a quadratic equation is called a symmetric function of α and β , when it remains unchanged by interchanging α and β .

Now we shall find the values of these symmetric functions in terms of the co-efficients of the quadratic equation. Since we directly find the values of $\alpha + \beta$ and $\alpha\beta$, every symmetric function must be expressed in terms of $\alpha + \beta$ and $\alpha\beta$.

Example 13. If a, β are the roots of the equation $2x^2+3x-5=0$, find the value of $\frac{\alpha}{\beta} + \frac{\beta}{\alpha}$.

Solution. The given quadratic equation is $2x^2+3x-5=0$. If α , β are the roots of the equation, then

$$\alpha + \beta = -\frac{b}{a} = -\frac{3}{2} \qquad [\text{Here } a = 2, b = 3, c = -5]$$

$$a\beta = \frac{c}{a} = -\frac{5}{2}$$
Now $\frac{a}{\beta} + \frac{\beta}{a} = \frac{a^2 + \beta^2}{\alpha\beta}$

$$= \frac{(\alpha + \beta)^2 - 2(\alpha\beta)}{a\beta}$$

$$= \frac{\left(-\frac{3}{2}\right)^2 - 2\left(-\frac{5}{2}\right)}{-\frac{5}{2}} = \frac{\frac{9}{4} + 5}{-\frac{5}{2}}$$

$$= \frac{\frac{29}{4}}{-\frac{5}{2}} = -\frac{29}{4} \times \frac{2}{5}$$
$$= -\frac{29}{10} = -2.9.$$

EXERCISE 2 (g)

(Section A)

If α , β are the roots of the equation $x^2-2x+3=0$, find the values of

(a)
$$a^2\beta + a\beta^2$$

$$(b) \quad \frac{1}{a} + \frac{1}{\beta}$$

(c)
$$a^2+\beta^2$$

(Section B)

If a, β are the roots of the equation $x^2-px+q=0$, find the values of

(a)
$$\frac{\alpha}{\beta} + \frac{\beta}{\alpha}$$

(b)
$$\alpha^3\beta + \alpha\beta^3$$

(c)
$$a^3 + \beta^3$$

(Section C)

Find the values of the following expressions, if a and β are the roots of the equation $ax^2+bx+c=0.$

(a)
$$(a+1)(\beta+1)$$

(b)
$$\left(\frac{\alpha}{\beta} - \frac{\beta}{\alpha}\right)^3$$
 (c) $\frac{1}{\alpha^3} + \frac{1}{\beta^3}$

$$(c) \quad \frac{1}{\alpha^3} + \frac{1}{\beta^3}$$

FACTORIZATION OF QUADRATIC POLYNOMIALS

Let us consider a quadratic polynomial $p(x) = ax^2 + bx + c$.

Let a be a root of the corresponding quadratic equation p(x)=0 i.e., $ax^2+bx+c=0$.

Then p(a)=0 and therefore by factor theorem $x-\alpha$ is a factor p(x).

Thus, if α and β are roots of the quadratic equation p(x)=0, then $(x-\alpha)(x-\beta)$ is a factor of p(x).

 $p(x) \equiv k(x-a)(x-\beta)$, where k is a non-zero real number.

So,
$$ax^2+bx+c=k(x-\alpha)(x-\beta)$$

Comparing the coefficients of x^2 on both sides, we get k=a

Then $p(x) \equiv a(x-a)(x-\beta)$

Thus, if a and β are the roots of the quadratic equation $ax^2+bx+c=0$, the quadratic polynomial ax^2+bx+c can be factorised as $a(x-\alpha)(x-\beta)$.

If $b^2-4ac \ge 0$, the quadratic equation $ax^2+bx+c=0$ has two real roots a and β where

$$a = \frac{-b + \sqrt{b^2 - 4ac}}{2a} \text{ and } \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}.$$

Hence the quadratic polynomial ax^2+bx+c has the factorisation $a(x-a)(x-\beta)$, where

$$\alpha = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$$
 and $\beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$.

If $b^2-4ac=0$, the quadratic equation $ax^2+bx+c=0$ has a real repeated root α , where $\alpha = -\frac{b}{2a}$. Hence the quadratic polynomial $ax^2 + bx + c$ has the factorisation $a(x-a)^2$

i.e.
$$a\left(x-\frac{b}{2}\right)^{2}$$

If $b^2-4ac < 0$, the quadratic equation $ax^2+bx+c=0$ has no real roots. Hence the quadratic polynomial ax^2+bx+c cannot be expressed as a product of two linear polynomials.

Example 14. Factorise the quadratic polynomial $\frac{1}{2}x^2-3x+4$ into linear factor over R, if possible.

Solution. The given polynomial is $\frac{1}{2}x^2 - 3x + 4$.

Here $a=\frac{1}{2}$, b=-3, c=4,

Now $b^2-4ac=(-3)^2-4(\frac{1}{2})(4)$

$$b^2 - 4ac > 0$$

So, there exists a factorisation into real linear factors.

$$a = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \qquad \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

$$= \frac{3+1}{2 \times \frac{1}{2}} \qquad = \frac{3-1}{2 \times \frac{1}{3}}$$

$$\alpha=4$$
, $\beta=2$.

 \therefore The factorisation is $\frac{1}{2}(x-4)(x-2)$ i.e., $(x-4)(\frac{1}{2}x-1)$.

Example 15. Factorise the quadratic polynomial $4\sqrt{3}x^2 + 5x - 2\sqrt{3}$ into linear factors over R, if possible.

Solution. The given polynomial is $4\sqrt{3}x^2+5x-2\sqrt{3}$.

Here $a=4\sqrt{3}$, b=5, $c=-2\sqrt{3}$

Now
$$b^{2}-4ac=(5)^{2}-4 (4\sqrt{3}) (-2\sqrt{3})$$

=25+96 =121

$$b^2-4ac>0.$$

So, there exists a factorisation into real linear factors.

$$\alpha = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \qquad \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

$$= \frac{-5 + \sqrt{121}}{2 \times 4\sqrt{3}}, \qquad \beta = \frac{-5 - \sqrt{121}}{2 \times 4\sqrt{3}},$$

$$= \frac{-5 + 11}{8\sqrt{3}}, \qquad = \frac{-5 - 11}{8\sqrt{3}}$$

$$\therefore \qquad \alpha = \frac{\sqrt{3}}{4}, \ \beta = \frac{-2}{\sqrt{3}}$$

... The factorisation is
$$4\sqrt{3}\left(x-\frac{\sqrt{3}}{4}\right)\left(x+\frac{2}{\sqrt{3}}\right)$$

$$i \cdot e \cdot , \qquad (4x-\sqrt{3})(\sqrt{3}x+2)$$

EXERCISE 2 (h)

(Section A)

- 1. Determine which of the following quadratic polynomials can be factorised into a product of real linear factors:
 - (a) $3x^2 + 5x + 2$ (c) $2x^2 - 5x + 7$

- (b) $3x^2+2x+1$
- (d) $\sqrt{3}x^2 + 10x + 8\sqrt{3}$

(Section B)

In the following, find the value(s) of k for which the quadratic has real linear factors:

(a)
$$2x^2 + 6x + k$$

(b) $kx^2 - 5x + 2$

(c) $3x^2-4x-2k$

(d) kx^2-4+3x

Factorise the following quadratic polynomials:

(a)
$$2x^2-3x+1$$

(b) $2x^2+11x+5$

(c)
$$6x^2-5x-21$$

(d) $\frac{1}{2}x^2 - 3x + 4$

(Section C)

Factorise the following quadratic polynomials into linear factors over R, if possible:

(a)
$$x^2+4x+2$$

(b) $2x^2+3x-7$

(c)
$$x^2+10x-2$$

(d) $3x^2+6x-2$

2'9. EQUATIONS REDUCIBLE TO QUADRATIC EQUATIONS

Sometimes we have to solve equations which, though not quadratic, can be reduced to quadratic equations by making suitable substitutions. We shall call such equations as equations reducible to quadratic equations. We shall now deal with several types of such equations.

Type 1. $ax^4+bx^2+c=0$.

The equation involves fourth degree polynomial having only even powers of x. Putting $x^2=z$, the equation reduces to $az^2+bz+c=0$ which being a quadratic in z can be solved.

Example 16. Solve $4x^4-25x^2+36=0$.

Solution. The given equation is $4x^4-25x^2+36=0$

Substituting

$$z=x^2$$
, we get $4z^3-25z+36=0$

or
$$4z^2 - 16z - 9z + 36 = 0$$

or
$$4z = 16z = 9z + 30 = 0$$

or $4z(z-4) = 9(z-4) = 0$

or
$$(z-4)(4z-9)=0$$

If
$$z-4=0$$
, then $z=4$

If
$$4z-9=0$$
, then $z=\frac{9}{4}$.

Now substituting $z=x^2$, we get

$$x^2 = 4$$
, $x^2 = \frac{9}{4}$.

$$\therefore x = \pm 2 \qquad \therefore x = \pm \frac{3}{2}$$

Let us verify these solutions of the given equation in x.

When
$$x=2$$
, L.H.S.= $4\times 2^4-25\times 2^2+36$

$$=64-100+36$$
 =0 =R.H.S.

When
$$x=-2$$
, L.H.S.= $4(-2)^4-25(-2)^2+36$
= $64-100+36$ = 0
= R.H.S.

When
$$x = \frac{3}{2}$$
, L H.S.=4 $\left(\frac{3}{2}\right)^4 - 25\left(\frac{3}{2}\right)^2 + 36$
=\frac{81}{4} - \frac{225}{4} + 36 = 0

When
$$x = -\frac{3}{2}$$
, L.H.S.= $4\left(-\frac{3}{2}\right)^4 - 25\left(-\frac{3}{2}\right)^3 + 36$
= $\frac{81}{4} - \frac{225}{4} + 36$ = 0
= R.H.S.

Thus, the solutions of the given equation are

$$x=\pm 2$$
 and $x=\pm \frac{3}{2}$.

Type 2.
$$py + \frac{q}{y} = r$$
.

Here y occurs in the denominator of one of the terms in the equation. So, we must seek those real values of y which are not zero and satisfy the given equation. By multiplying both sides by y, the equation reduces to $py^2+q=ry$ or $py^2-ry+q=0$. This is a quadratic equation in y and can be solved for y.

Example 17. Solve $2x + \frac{4}{x} = 9$.

Solution. The given equation is $2x + \frac{4}{x} = 9$

Multiplying both sides by x, we get

$$2x^2+4=9x$$
, when $x\neq 0$
 $2x^2-9x+4=0$

Oľ

The solutions are

$$x = \frac{-(-9) \pm \sqrt{(-9)^2 - 4 \times 2 \times 4}}{2 \times 2} = \frac{9 \pm \sqrt{81 - 32}}{4}$$

Then

$$x = \frac{9 \pm 7}{4}$$
 i.e., 4, $\frac{1}{2}$

Thus, the solutions of the equation are x=4 and $x=\frac{1}{2}$.

Type 3.
$$\sqrt{a-x^2}=bx+c$$

This equation involves only one radical. Here we have to seek those solutions for which $a-x^2 \ge 0$ i.e., $x^2 \le a$ and R.H.S. ≥ 0 i.e., $bx+c \ge 0$. Thus, we need solutions for which $x^2 \le a$ and $bx+c \ge 0$.

Squaring both sides of the equation, we get

or
$$a-x^2=(bx+c)^2$$

or $a-x^2=b^2x^2+2(bx)c+c^2$
or $(b^2+1)x^2+2bcx+(c^2-a)=0$.

It is a quadratic equation which can be solved for x, where $x^2 \le a$ and bx+c > 0.

Example 18. Solve $x - \sqrt{25 - x^2} = 1$.

Solution. The given equation is $x - \sqrt{25 - x^2} = 1$.

It can be written as

$$x-1=\sqrt{25-x^2}$$

Here we have to seek solutions for which $25-x^2 \ge 0$ i.e., $x^2 \le 25$ and $x-1 \ge 0$ i.e., $x \ge 1$.

Now squaring both sides of the equation, we get

$$x^2 - 2x + 1 = 25 - x^2$$
$$2x^2 - 2x - 24 = 0$$

$$x^2 - x - 12 = 0$$

The roots of the equation are

$$x = \frac{-(-1) \pm \sqrt{(-1)^2 - 4 \times 1 \times (-12)}}{2 \times 1}$$
$$= \frac{1 \pm \sqrt{1 + 48}}{2} = \frac{1 \pm 7}{2}$$

$$x=4, -3.$$

These roots must satisfy both the conditions, $x^2 \le 25$ and $x \ge 1$.

We find that x=4 is the only solution of the given equation, satisfying both the conditions.

EXERCISE 2 (i)

(Section A)

Solve the following equations by reducing them to quadratic equations:

1.
$$x^4 - 13x^2 + 36 = 0$$
.

2.
$$25x^4-20x^2+4=0$$
.

3.
$$2x^4 - 5x^2 + 3 = 0$$
.

4.
$$9x^4 - 148x^2 + 64 = 0$$
.

5.
$$2x - \frac{3}{x} = 1$$
.

6.
$$3x + \frac{5}{16x} = 2$$
.

7.
$$\sqrt{3x^2-2} = 2x-1$$

8.
$$\sqrt{13-x^2}=x+5$$
.

(Section B)

Determine the real solutions of the following equations:

9.
$$3x-5\sqrt{x+2}=0$$
.

10.
$$\sqrt{x+2x}=1$$
.

11.
$$8x^6 - 91x^3 + 216 = 0$$
.

12.
$$x^{2/3}+12=7x^{1/3}$$
.

13.
$$x+\sqrt{x-2}=8$$
.

14.
$$x-\sqrt{3x-6}=2$$
.

[C.B.S.E., 1979 (A.I.)]

(Section C)

15.
$$3^{2x}-10.3^{x}+9=0$$
.

16.
$$4^x - 36 \cdot 2^x + 128 = 0$$
.

Type 4.
$$\sqrt{ax+b} \pm \sqrt{cx+d} = e$$

This equation involves two radicals. Here we have to seek those solutions for which $ax+b \ge 0$ and $cx+d \ge 0$. The following solved example will help you to understand the method of solving such equations.

Example 19. Solve $\sqrt{2x+9} - \sqrt{x-4} = 3$.

Solution. The given equation is

$$\sqrt{2x+9} - \sqrt{x-4} = 3$$

Here we must look for solutions which satisfy

$$2x+9 \ge 0$$
 i.e., $x \ge -\frac{9}{2}$...(1)

$$x-4 \ge 0$$
 i.e., $x \ge 4$...(2)

In order to satisfy both conditions (1) and (2), we must have $x \ge 4$.

The equation can be written as:

$$\sqrt{2x+9} = 3 + \sqrt{x-4}$$

Squaring both the sides, we get

$$2x + 9 - 9 + 6x / x - 4 + x - 4$$

Regrouping the terms so that the radical is one side and all other terms are on the other side, we get

$$2x - x + 9 - 9 + 4 = 6\sqrt{x - 4}$$
or
$$x + 4 = 6\sqrt{x - 4}$$

Squaring both sides again, we get

Squaring both sides again, we get
$$x^{2}+8x+16=36 (x-4)$$
or
$$x^{2}+8x+16=36x-144$$
or
$$x^{2}+8x-36x+16+144=0$$
or
$$x^{2}-28x+160=0$$
or
$$x^{2}-20x-8x+160=0$$
or
$$x(x-20)-8(x-20)=0$$
or
$$(x-20)(x-8)=0$$

If x-20=0, then x=20

If x-8 = 0. then x=8.

Thus, the roots of the equation are x=8 and x=20.

Since both roots satisfy the above condition $x \ge 4$, both are the solutions of the given equation. Hence, the required solutions are x=8, x=20.

Type 5.
$$a\left(x^2 + \frac{1}{x^2}\right) + b\left(x + \frac{1}{x}\right) + c = 0$$
.

This equation can be rewritten as a quadratic equation in terms of $x + \frac{1}{x}$. On solving it, we get Type 2 form discussed before.

Example 20. Solve
$$2\left(x^2 + \frac{1}{x^2}\right) - 3\left(x + \frac{1}{x}\right) - 1 = 0, x \neq 0.$$

Solution. The given equation is

$$2\left(x^{2} + \frac{1}{x^{2}}\right) - 3\left(x + \frac{1}{x}\right) - 1 = 0.$$
Let $x + \frac{1}{x} = y$ Then $x^{2} + \frac{1}{x^{2}} = y^{2} - 2$.

Substituting these in the given equation, we have

$$2(y^2-2)-3y-1=0$$

or
$$2y^2 - 3y - 5 = 0$$
.

The roots of the equation are

$$y = \frac{-(-3) \pm \sqrt{\frac{9-4 \times 2 \times (-5)}{2 \times 2}}}{2 \times 2} \quad i.e., \quad y = \frac{3 \pm \sqrt{\frac{9+40}{4}}}{4}$$

$$\therefore \qquad y = \frac{3+7}{4}, \quad y = \frac{3-7}{4} \qquad i.e., \quad y = \frac{5}{2}, \quad y = -1$$
Now
$$y = x + \frac{1}{x} \qquad \therefore \quad x + \frac{1}{x} = \frac{5}{2}$$
or
$$2x^2 + 2 = 5x \quad \text{or} \quad 2x^2 - 5x + 2 = 0$$

$$\therefore x = \frac{-(-5) \pm \sqrt{25 - 4 \times 2 \times 2}}{2 \times 2} = \frac{5 \pm \cdot 9}{4}$$

Then
$$x = \frac{5+3}{4}$$
, $x = \frac{5-3}{4}$ i.e., $x = 2$, $x = \frac{1}{2}$

Again
$$y=x+\frac{1}{x}$$
 \therefore $x+\frac{1}{x}=-1$

or
$$x^2+1=-x$$
 or $x^2+x+1=0$

Here
$$b^2-4ac=1-4\times1\times1=-3$$
.

Since $b^2-4ac < 0$, this equation has no real roots.

Thus, the solutions of the given equation are

$$x=2, x=\frac{1}{2}$$

We give below more examples of equations reducible to quadratic equations.

Example 21. Solve
$$\left(\frac{2x-3}{x-1}\right) - 4\left(\frac{x-1}{2x-3}\right) = 3, \ x \neq 1, \ x \neq \frac{3}{2}$$
.

[C.B.S.E., 1978, (A.I.)]

Solution. The given equation is

$$\left(\frac{2x-3}{x-1}\right)-4\left(\frac{x-1}{2x-3}\right)=3.$$

Substituting $\frac{2x-3}{x-1} = y$ in the equation, we have

$$y-4\times\frac{1}{y}=3$$

$$y^2 - 4 = 3v$$

or
$$v^2 - 3v - 4 = 0$$

The roots of the equation are

$$y = \frac{-(-3) \pm \sqrt{9 - 4 \times 1 \times (-4)}}{2 \times 1} = \frac{3 \pm \sqrt{9 + 16}}{2}$$

$$y = \frac{3+5}{2}, \quad y = \frac{3-5}{2} \quad i.e., \quad y = 4, \quad y = -1$$

Now
$$y = \frac{2x-3}{x-1}$$

$$y = \frac{2x-3}{x-1} \qquad \therefore \qquad \frac{2x-3}{x-1} = 4$$

or
$$2x-3=4x-4$$

or
$$2x-4x=-4+3$$

or
$$-2x=-1$$

or
$$2x=1$$

Also
$$\frac{2x-3}{x-1} = -1$$

or
$$2x-3 = -x+1$$

or
$$2x + x = 1 + 3$$

or
$$3x=4$$

$$\therefore x = \frac{4}{3}$$

 $x=\frac{1}{2}$

Hence the solutions of the given equation are

$$x = \frac{1}{2}, x = \frac{4}{3}$$

Example 22. Solve $7^{1+x}+7^{1-x}=50$

Solution. The given equation is

$$7^{1+x} + 7^{1-x} = 50$$

or
$$7.7^{x}+7.7^{-x}=50$$
 or $7.7^{x}+7.\frac{1}{7^{x}}=50$

Substituting $7^{z} = y$, we get

$$7y + \frac{7}{y} = 50 \qquad \text{or} \quad 7y^2 + 7 = 50y$$
or
$$7y^2 - 50y + 7 = 0$$
or
$$7y^2 - 49y - y + 7 = 0$$

or
$$7y(y-7)-1(y-7)=0$$

or
$$(y-7)-1(y-7)=0$$

or $(y-7)(7y-1)=0$

If
$$y-7=0$$
, then $y=7$,

If
$$7y-1=0$$
, then $y=\frac{1}{7}$

Now
$$y=7$$
, $y=\frac{1}{7}$
 $\therefore 7^{x}=7^{1}$, $7^{x}=7^{-1}$

Since the bases are same on both sides of the equation, so equating their exponents, we

x = -1x=1.

Hence the solutions of the given equation are

$$x=1, x=-1$$

EXERCISE 2 (j)

(Section A)

Solve the following by reducing them to quadratic equations:

1.
$$\sqrt{x+4} + \sqrt{x-5} = 3$$

get

2.
$$\sqrt{1-5x} + \sqrt{1-3x} = 2$$

3.
$$\sqrt{2x+1} + \sqrt{x+4} = 3$$

4.
$$\sqrt{2x+3} - \sqrt{x+1} = 1$$

5.
$$\left(x^2 + \frac{1}{x^2}\right) + 4\left(x + \frac{1}{x}\right) + 6 = 0, \quad x \neq 0$$

6.
$$9\left(x^2 + \frac{1}{x^2}\right) - 27\left(x + \frac{1}{x}\right) + 8 = 0, \quad x \neq 0$$

7.
$$3^{\kappa-1}+3^{1-\kappa}=2$$
 8. $5^{1+\kappa}+5^{1-\kappa}=26$

(Section B)

Solve the following equations:

9.
$$\left(\frac{2x+1}{x-1}\right) + \left(\frac{x-1}{2x+1}\right) = 2\frac{1}{2}, \quad x \neq 1, \quad x \neq -\frac{1}{2}.$$

10.
$$\left(\frac{2x-1}{x+1}\right) - 15\left(\frac{x+1}{2x-1}\right) = -2, \quad x \neq -1, \quad x \neq \frac{1}{2}.$$
 [C.B.S.E., 1986 (A.I.)]

11.
$$2\left(x^2 + \frac{1}{x^2}\right) + \left(x - \frac{1}{x}\right) - 10 = 0, \quad x \neq 0.$$

12.
$$8\sqrt{\frac{x}{x+3}} - \sqrt{\frac{x+3}{x}} = 2$$
, $x \neq 0$, $x \neq -3$. [C.B.S.E., 1986 (Delhi)]

13.
$$\left(x^2 + \frac{1}{x^2}\right) - 3\left(x - \frac{1}{x}\right) - 2 = 0, \quad x \neq 0.$$

14.
$$\sqrt{\frac{x}{1-x}} + \sqrt{\frac{1-x}{x}} = 2\frac{1}{6}, \ x \neq 0, \ x \neq 1.$$

(Section C)

Solve for x:

15.
$$\sqrt{(x-1)(x-2)} + \sqrt{(x-3)(x-4)} = 2$$

16.
$$\sqrt{2x^2+x+3} + \sqrt{2x^2+x-6} = 3$$

2.10. PROBLEMS INVOLVING QUADRATIC EQUATIONS

There are many word problems which can be solved by setting up a quadratic equation whose solution will be a solution to the problem. Sometimes only one root out of two roots of the quadratic equation has a meaning for the problem. Any root of the quadratic equation not satisfying the conditions of the given problem must be rejected.

The method of solving verbal problems leading to quadratic equations consists of

- (1) translating the word problem into the symbolic language,
- (2) solving the equation, and
- (3) interpreting the solution of the equation.

The following example will illustrate the method:

is 274. Find the numbers. The difference of two positive integers is 8 and the sum of their squares

Solution. Let one number be x.

Then the other number = x+8

Sum of their squares=274

Then
$$x^2 + (x+8)^2 = 274$$

or
$$x^2 + x^2 + 16x + 64 = 274$$

or
$$2x^2 + 16x - 210 = 0$$

or
$$x^2 + 8x - 105 = 0$$

or
$$x^2 + 15x - 7x - 105 = 0$$

or
$$x(x+15)-7(x+15)=0$$

or
$$(x+15)(x-7)=0$$

If
$$x+15=0$$
, then $x=-15$.

If
$$x-7=0$$
, then $x=7$.

Rejecting the negative value as given numbers are positive integers, we get

$$x=7$$

One number is 7. Then the other number is 7+8, i.e., 15.

So required numbers are 7 and 15.

Example 24. A man covers a distance of 200 km travelling with a uniform speed of (x+5) km per hour. The distance could have been covered in 2 hours less had the speed been (x+5) km per hour. Calculate the value of x.

Solution. In first case, the time taken by the man to cover 200 km at x km per

hour =
$$\frac{200}{x}$$
 hours.

In second case, the time taken by the man to cover 200 km at (x+5) km per

$$hour = \frac{200}{x+5} hours$$

According to the given condition,

or
$$\frac{200}{x} - \frac{200}{x+5} = 2$$
or
$$\frac{100}{x} - \frac{100}{x+5} = 1$$
or
$$100(x+5) - 100x = x(x+5)$$
or
$$100x + 500 - 100x = x^2 + 5x$$
or
$$x^2 + 5x - 500 = 0$$
or
$$x^2 + 25x - 20x - 500 = 0$$
or
$$x(x+25) - 20(x+25) = 0$$
or
$$(x+25)(x-20) = 0$$

$$x = -25, 20.$$

Rejecting the negative value, we get the value of x as 20 km/hour.

EXERCISE 2 (k)

Numbers:

- Thrice the square of a number is 243. Find the number. 1.
- The product of two consecutive odd numbers is 399. Find the numbers. 2.
- Find two consecutive even numbers such that the sum of their squares is 100. 3.
- The sum of two numbers is 25 and the sum of their squares is 313. Find the numbers.
- The sum of the squares of two consecutive positive integers is 545. Find the 5. numbers.
- The sum of the squares of three consecutive natural numbers is 194. Find them. 6.
- The product of two successive multiples of 3 is 180. Determine the multiples. 7.
- Find a possible number which when decreased by 20 is equal to 69 times the reciprocal 8. of the number.
- Find two natural numbers which differ by 3 and the sum of whose squares is 117. 9.
- Five times a certain whole number is equal to three less twice the square of the number. 10. Find the number.
- A body travels at x metres per minute for 8 minutes and then for another 4x minutes 11. at the same speed. If the total distance covered is 117 metres, find the speed of the
- Divide 41 into two parts whose product is 288. 12.
- Divide 15 into two parts such that the sum of their squares is 113. 13.
- The sum of a number and its reciprocal is $2\frac{4}{15}$. What is the number? 14.

Area:

- The sides of a right-angled triangle containing the right angle are 5x cm and (3x-1) cm. If the area of the triangle be 60 cm², calculate the lengths of the sides 15. of the triangle.
- Let x denote the breadth of a rectangle whose length exceeds the breadth by 3 units. If the numerical values of the area and the perimeter of the rectangle are equal, find x. [C.B.S.E., 1978 (A.I.)]

- 17. A rectangle has an area of 24 cm^2 . If its length is x cm, write down its breadth in terms of x. Given that its perimeter is 20 cm, form an equation in x and solve it. Also find the dimensions of the rectangle.
- 18. The perimeter of a rectangle is 82 m and its area is 400 m². Find the breadth of the rectangle. [C.B.S.E., 1981 (Delhi)]
- 19. The area of a right triangle is 66 sq. cm. If the base of the triangle exceeds that of its altitude by 5 cm, find the altitude of the triangle.

 [C.B.S.E., 1984 (A.I.)]
- 20. The hypotenuse of a right-triangle is 13 cm and the difference between the other two sides is 7 cm.
 - (i) Taking 'x' as the length of the shorter of the two sides, write an equation in 'x' that represents the above statement.
 - (ii) Solve the equation obtained in (i) above, and hence find the two unknown sides of the triangle.
- 21. The length of a verandah is 3 m more than its breadth. The numerical value of its area is equal to the numerical value of its perimeter.
 - (i) Taking 'x' as the breadth of the verandah, write an equation in 'x' that represents the above statement.
 - (ii) Solve the equation obtained in (i) above and hence find the dimensions of the verandh.

Mixed:

- 22. If a cyclist had gone 3 km per hour faster, he would have taken 1 hour 20 minutes less to ride 80 km. What time did he take?
- 23. AB is a segment line whose length is 6 cm. Find a point P in it such that AB.PB=AP².
- 24. Three consecutive numbers are such that the square of the middle number exceeds the difference of the squares of the other two by 60. Assume the middle number to be x and form a quadratic equation satisfying the above statement. Hence find the three numbers.
- 25. The sum of the ages of Puneet and his father is 45 years and the product of their ages is 126. Find the ages of the father and the son.
- 26. The product of Ravi's age (in years) five years ago with his age (in years) 9 years later is 15. Find Ravi's present age.
- 27. A train covers a distance of 200 km between two stations at a speed of 'x' km/hour. Another train covers the same distance at a speed of (x+5) km/hour.
 - (i) Find the time which each train takes to cover the distance between the stations.
 - (ii) If the second train takes two hours less than the first, find the value of 'x'.
- 28. A trader bought a number of articles for Rs. 1200. Ten were damaged and he sold each of the rest at Rs. 2 more than what he paid for it, thus clearing a profit of Rs. 60 on the whole transaction. Taking the number of articles he bought as x, form an equation in x and solve it.
- 29. Some students planned a picnic. The budget for food was Rs. 24. Because four of them failed to go, the cost of food to each member got increased by Re. I. How many students attended the picnic?

 [C.B.S.E., 1983 (A.I.)]
- 30. The length of the hypotenuse of a right triangle exceeds the length of the base by 2 cm and exceeds twice the length of the altitude by 1 cm. Find the length of each side of the triangle.

[C.B.S.E., 1978 (Delhi)]

RATIONAL EXPRESSIONS

3.1. In your previous class you have learnt about H.C.F. and L.C.M. of two polynomials. Remember that the H.C.F. is also called the greatest common divisor, written in short as G.C.D.

EXERCISE 3 (a)

- 1. Find the g.c.d. of the polynomials $(x-3)^2(x-2)(x+1)^2$ and $(x-3)(x+1)^2(x-4)$.
- 2. Find the g.c.d of the polynomials $4(x+3)^2(x-1)(x+1)^3$ and $6(x-1)^2(x+1)^2(x+7)$.
- 3. Find the g.c.d. of the two polynomials:

$$p(x)=x^2-5x+6$$
 and $q(x)=x^2+5x-14$.

4. Find the g.c.d. of the two polynomials:

$$p(x) = 6x^2 + 11x + 3$$
 and $q(x) = 2x^2 + x - 3$

- 5. Find the g.c.d. of the following pair of polynomials: $24(6x^4-x^3-2x^2): 20(2x^6+3x^5+x^4)$.
- 6. Find the l.c.m. of the polynomials $(x+3)(x-2)^2$ and (x-2)(x-6).
- 7. Find the l.c.m. of the two polynomials,

$$p(x)=x^2+7x+12$$
 and $q(x)=x^2+8x+16$.

8. Find the l.c.m. of the two polynomials,

$$p(x) = -x^2 - x + 6$$
 and $q(x) = -x^2 + x + 2$.

- 9. Find the l.c.m. of the following pair of polynomials: $(x+3)(-6x^2+5x+4)$; $(2x^2+7x-3)(x+3)$.
- 10. Find the l.c.m. of the polynomials:

$$x^3 - x^2 - 5x + 2$$
 and $x^3 + 4x^2 + x - 6$.

3'2. RATIONAL EXPRESSION

Let us recall the properties of integers and polynomials. Now compare the properties of integers with those of polynomials.

What do you observe?

We observe that polynomials possess properties exactly similar to those of integers. So, we may say that polynomials behave like integers. We form rational expressions from polynomials just as we formed rational numbers from integers.

A rational number is the quotient $\frac{m}{n}$ of two integers m and n where $n\neq 0$. Similarly,

if p(x) and q(x) are two polynomials, then $\frac{p(x)}{q(x)}$ need not be a polynomial, where q(x) is a

non-zero polynomial. Then we say that $\frac{p(x)}{q(x)}$ is a rational expression.

We define a rational expression as the quotient $\frac{p(x)}{q(x)}$ of two polynomials p(x) and q(x), where q(x) is not the zero polynomial.

In the rational expression $\frac{p(x)}{q(x)}$, p(x) is called the **numerator**

, g(x) is called the **denominator**;

p(x) and q(x) are called the **terms** of the expression.

By this definition every integer, every rational number and, in general, every polynomial is also a rational expression:

3,
$$\frac{1}{5}$$
, x^2 , $5x^2+3$, $\frac{1}{x}$, $\frac{x^2-2x+1}{x^3+1}$, $\frac{x-\frac{1}{2}}{\frac{1}{2}x+\frac{3}{5}}$

These are all examples of rational expressions.

EXERCISE 3 (b)

(Section A)

1. Which of the following are rational expressions?

(a)
$$\frac{x^2-x+3}{x+5}$$

(b)
$$\frac{x^2-2}{3\sqrt{x+5}}$$

(c)
$$\frac{\sqrt{3}x^2 - 4x + 7}{2x - \sqrt{6}}$$

(d)
$$\frac{x^3+3x^2-1}{x^2+\sqrt{x-2}}$$
.

(Section B)

- 2. Write a rational expression whose numerator is a linear polynomial and denominator is a quadratic polynomial.
- 3. Write a rational expression whose numerator is a binomial and whose denominator is a trinomial.

(Section C)

4. Write a rational expression whose numerator is a quadratic polynomial whose zeros are 1 and -2 and whose denominator is a quadratic polynomial whose zeros are 2 and $\frac{1}{3}$.

3'3. RATIONAL EXPRESSIONS IN LOWEST TERMS

You know that a rational number $\frac{m}{n}$ is said to be in its lowest terms if g.c.d. of its numerator and denominator i.e., m and n is 1. If $\frac{m}{n}$ is not in its lowest terms, we get it in the lowest terms by cancelling the g.c.d. from both the numerator and denominator. In the same way, a rational expression is expressed in its lowest terms by cancelling out non-zero common factors (g.c.d.) of both the numerator and denominator.

When a rational expression is written in its lowest terms, it is in its simplest form.

Example 1. Reduce to lowest terms: $\frac{x^2+x-2}{x^2-9x+18}$

Solution. Numerator
$$= x^2 + x - 2$$

= $x^2 + 2x - x - 2$
= $x(x+2) - 1$ (x+2) = (x+2)(x-1)

Denominator=
$$x^3-9x+18$$

= $x^2-6x-3x+18$
= $x(x-6)-3(x-6)$ = $(x-6)(x-3)$

... g.c.d. of the numerator and denominator=1.

Thus, the given rational expression is in lowest terms.

Example 2. Reduce the rational expression $\frac{4x^2-4}{2x^2+6x-8}$ to its lowest terms.

Solution.
$$p(x)=4x^2-4 = 4(x^2-1)$$

 $=4(x+1)(x-1)$
 $q(x)=2x^2+6x-8=2(x^2+3x-4)$
 $=2[x^2+4x-x-4]$
 $=2[x(x+4)-1(x+4)]$
 $=2(x+4)(x-1)$

 \therefore g c.d. of p(x) and q(x) is 2 (x-1).

Now
$$\frac{4x^2-4}{2x^2+6x-8} = \frac{{}^{r}4(x+1)(x-1)}{2(x+4)(x-1)} = \frac{2(x+1)}{x+4}, x \neq 1$$

[Cancelling the g.c.d. 2 (x-1), we get the simplest form.]

EXERCISE 3 (c)

(Section A)

Reduce the following rational expressions to their simplest form:

1.
$$\frac{(x+3)(x-2)}{(x-1)}$$

2.
$$\frac{(x+2)(x-3)}{(x+1)(x-2)}$$

3.
$$\frac{3x-3}{5x-5}$$

4.
$$\frac{x^2-3x}{9x-x^3}$$

5.
$$\frac{(x-3)(x+2)}{(x+2)(x+1)}$$

6.
$$\frac{x^2-9}{2x^3-6x^2}$$

(Section B)

Reduce the following rational expressions to their lowest terms:

7.
$$\frac{x^2 - 6x + 8}{x^2 - 5x + 6}$$

8.
$$\frac{x^2-2x-3}{2x^2-5x-3}$$

$$9. \quad \frac{6x^2 - 7x - 5}{6x^2 - 19x + 15}$$

10.
$$\frac{15x^2 - 35x + 10}{x^2 - 7x + 10}$$

11.
$$\frac{6x^2-7x-20}{9x^2+6x-8}$$

12.
$$\frac{6x^2 - 7xy - 5y^2}{6x^2 - xy - 15y^2}$$

3.4. ADDITION OF RATIONAL EXPRESSIONS

If $\frac{p(x)}{q(x)}$ and $\frac{r(x)}{s(x)}$ are two rational expressions, we define their sum as,

$$\frac{p(x)}{q(x)} + \frac{r(x)}{s(x)} = \frac{p(x)s(x) + q(x)r(x)}{q(x)s(x)}.$$

The definition of addition implies that

$$\frac{p(x)}{q(x)} + \frac{r(x)}{q(x)} = \frac{p(x) + r(x)}{q(x)}$$

Example 3. Find the sum of
$$\frac{5x+3}{2x+1}$$
 and $\frac{3x-4}{2x+1}$

Solution.
$$\frac{5x+3}{2x+1} + \frac{3x-4}{2x+1} = \frac{5x+3+3x-4}{2x+1}$$
$$= \frac{8x-1}{2x+1}.$$

Example 4. Find the sum of $\frac{x-2}{x-1}$ and $\frac{x+1}{x+2}$.

Solution.
$$\frac{x-2}{x-1} + \frac{x+1}{x+2} = \frac{(x-2)(x+2) + (x+1)(x-1)}{(x-1)(x+2)}$$
$$= \frac{x^2 - 4 + x^2 - 1}{x^2 + x - 2}$$
$$= \frac{2x^2 - 5}{x^2 + x - 2}.$$

EXERCISE 3 (d)

(Section A)

Find the sum of the following pairs of rational expressions:

1.
$$\frac{x}{x-a}$$
, $\frac{a}{x-a}$.

2.
$$\frac{x-3}{x+5}$$
, $\frac{x-2}{x+5}$

3.
$$\frac{x^2+1}{x+3}$$
, $\frac{x^2-3}{x+3}$.

4.
$$\frac{x}{x-a}$$
, $\frac{a}{a-x}$

5.
$$\frac{x+y}{x}$$
, $\frac{x-y}{y}$.

6.
$$\frac{a-b}{ab}$$
, $\frac{b-c}{bc}$

(Section B)

Find the sums:

7.
$$\frac{x+2}{x+3} + \frac{x-1}{x-2}$$

8.
$$\frac{2}{3x(x+1)} + \frac{1}{9(x+1)}$$

9.
$$\frac{x}{x^2-36}+\frac{1}{x+6}$$

10.
$$\frac{x+1}{(x-1)^2} + \frac{1}{x+1}$$

11.
$$\frac{x^2+xy+y^2}{x+y}+\frac{x^2-xy+y^2}{x-y}$$
.

12.
$$\frac{3}{1-25x^2} + \frac{1}{(5x-1)(x+1)}$$

(Section C)

Simplify:

13.
$$\frac{x^2+x-1}{x^2-1}+\frac{x+1}{x^3+2}$$

14.
$$\frac{1}{x+y} + \frac{1}{x-y} + \frac{2x}{x^2+y^2}$$

15.
$$\frac{x+3}{x^2-3x+2} + \frac{x+2}{x^2-4x+3} + \frac{x+1}{x^2-5x+6}$$

3.5. ADDITION PROPERTIES OF RATIONAL EXPRESSIONS

Let us discuss addition properties of rational expressions. It is easy to verify them what we have discussed so far.

(1) For any two rational expressions $\frac{p(x)}{q(x)}$ and $\frac{r(x)}{s(x)}$,

$$\frac{p(x)}{q(x)} + \frac{r(x)}{s(x)}$$
 is also a rational expression.

We say that the rational expressions are closed under addition.

(2) For any two rational expressions $\frac{p(x)}{q(x)}$ and $\frac{r(x)}{s(x)}$,

$$\frac{p(x)}{q(x)} + \frac{r(x)}{s(x)} = \frac{r(x)}{s(x)} + \frac{p(x)}{q(x)}$$

We say that addition of rational expressions is commutative.

(3) For any three rational expressions $\frac{p'(x)}{q(x)}$, $\frac{r(x)}{s(x)}$ and $\frac{u(x)}{v(x)}$,

$$\left[\frac{p(x)}{q(x)} + \frac{r(x)}{s(x)}\right] + \frac{u(x)}{v(x)} = \frac{p(x)}{q(x)} + \left[\frac{r(x)}{s(x)} + \frac{u(x)}{v(x)}\right]$$

We say that addition of rational expressions is associative.

(4) For any rational expression $\frac{p(x)}{a(x)}$,

$$\frac{p(x)}{q(x)} + \frac{0}{1} = \frac{p(x)}{q(x)}$$

We say that zero rational expression i.e. $\frac{0}{1}$ is the additive identity for rational expressions.

(5) For any rational expression $\frac{p(x)}{q(x)}$, there exists another rational expression $\frac{p(x)}{q(x)}$ such that

$$\frac{p(x)}{q(x)} + \frac{-p(x)}{q(x)} = 0.$$

We say that $\frac{-p(x)}{q(x)}$ is the additive inverse of $\frac{p(x)}{q(x)}$.

Now we can define subtraction of two rational expressions. If $\frac{p(x)}{q(x)}$ and $\frac{r(x)}{s(x)}$ are rational expressions, we define $\frac{p(x)}{q(x)} - \frac{r(x)}{s(x)}$ as $\frac{p(x)}{q(x)} + \frac{-r(x)}{s(x)}$ which is equal to $\frac{p(x)s(x) - r(x)q(x)}{q(x)s(x)}$.

Example 5. Find the additive inverse of $\frac{x^2-5x}{2x+1}$.

Solution. The additive inverse of $\frac{x^2-5x}{2x+1}$ is $\frac{-(x^2-5x)}{2x+1}$ i.e. $\frac{-x^2+5x}{2x+1}$.

Example 6. Express $\frac{2}{(x-1)^2} - \frac{3}{x^2-1}$ as a rational expression.

Solution.
$$\frac{2}{(x-1)^2} - \frac{3}{x^2 - 1} = \frac{2}{(x-1)^2} + \frac{(-3)}{(x+1)(x-1)}$$
$$= \frac{2(x+1) + (-3)(x-1)}{(x+1)(x-1)^2}$$
$$= \frac{2x + 2 - 3x + 3}{(x+1)(x-1)^2}$$
$$= \frac{-x + 5}{(x+1)(x-1)^2}.$$

EXERCISE 3 (e)

(Section A)

- 1. What is the additive identity for rational expression $\frac{2x^2-1}{x+3}$?
- 2. What is the additive inverse of $\frac{x^2+1}{x-1}$?
- 3. Find the additive inverse of $\frac{x^2-3x}{x+2}$.

(Section B)

Express the following as rational expressions:

4.
$$\frac{5}{x-y} - \frac{2}{x-y}$$

5.
$$\frac{3}{x-y} + \frac{1}{y-x}$$

6.
$$\frac{x+1}{x-1} - \frac{x-1}{x+1}$$

7.
$$\frac{x-5}{x+5} - \frac{x+5}{x-5}$$

8.
$$\frac{4x}{x^2-1} - \frac{x-3}{x+1}$$

9.
$$\frac{3x}{(x-2)^2} - \frac{4}{x-2}$$

(Section C)

10. Simplify:
$$\frac{x^2+2}{x-1} - \frac{x-3}{x+1}$$
.

11. Simplify:
$$\frac{x}{x-y} + \frac{y}{x+y} - \frac{2xy}{x^2-y^2}$$
.

12. Simplify:
$$\frac{x+1}{x-1} + \frac{x-1}{x+1} - \frac{3x^2}{x-1}$$
.

13. Simplify:
$$\frac{4x}{x^2-3x+2} - \frac{4}{1-x} - \frac{5}{x-2}$$

14. Simplify:
$$\left(\frac{x^2+1}{x-1} + \frac{x+1}{2x+1}\right) - \left(\frac{x-1}{x+2} + \frac{x+1}{x-2}\right)$$

3.6. MULTIPLICATION OF RATIONAL EXPRESSIONS

If $\frac{p(x)}{q(x)}$ and $\frac{r(x)}{s(x)}$ are two rational expressions, we define their multiplication as, $\frac{p(x)}{q(x)} \times \frac{r(x)}{s(x)} = \frac{p(x) r(x)}{q(x) s(x)}$.

Example 7. Find the product of $\frac{5x+2}{5x-3}$ and $\frac{x+6}{x+2}$.

Solution.
$$\frac{5x+2}{5x-3} \times \frac{x+6}{x+2} = \frac{(5x+2)(x+6)}{(5x-3)(x+2)}$$
$$= \frac{5x^2+32x+12}{5x^2+7x-6}.$$

Example 8. Multiply $\frac{x^2+10x+25}{x^2+5x+6}$ by $\frac{x-3}{x^2-25}$.

Solution.
$$\frac{x^2 + 10x + 25}{x^2 + 5x + 6} \times \frac{x - 3}{x^2 - 25} = \frac{(x + 5)^2(x - 3)}{(x + 2)(x + 3)(x + 5)(x - 5)}$$

The factors of the numerator are (x+5), (x+5), (x-3).

The factors of the denominator are (x+2), (x+3), (x+5), (x-5).

Their g.c.d.=
$$(x+5)$$

Cancelling the g.c.d., we get the product in lowest terms as $\frac{(x+5)(x-3)}{(x+2)(x+3)(x-5)} = \frac{x^2+2x-15}{x^3-19x-30}.$

EXERCISE 3 (f)

(Section A)

Find the product of the following pairs of rational expressions and express the product in its lowest terms:

1.
$$\frac{2x+2}{x-1}$$
, $\frac{x+3}{x-2}$.

2.
$$\frac{x^2+1}{x-1}$$
, $\frac{x+1}{x^2-2}$.

3.
$$\frac{x^2-4}{x+1}$$
, $\frac{2x+2}{x-2}$

4.
$$\frac{x^2-9}{x+2}$$
, $\frac{x^2-4}{x+3}$.

(Section B)

Multiply the following pairs of rational expressions and express the product in its lowest terms:

5.
$$\frac{x^2+11x+28}{x^2+11x+30}$$
, $\frac{x^2-36}{x^2-49}$.

6.
$$\frac{4x^2-9}{2x^2+5x+3}$$
, $\frac{x(x+1)}{2x-3}$.

7.
$$\frac{x^2+ax}{ax-bx}$$
, $\frac{b^2-a^2}{x^2-a^2}$

8.
$$\frac{2x^2-5x-3}{ax^2-a}$$
, $\frac{2ax^2+ax-3a}{2x^3-3x-9}$.

(Section C)

9. Simplify:
$$\frac{1-x}{1+y} \times \frac{1-y^2}{x+x^3} \times \frac{1}{1-x}$$

10. Simplify:
$$\frac{x^3 - y^3}{x^2 - y^2} \times \frac{x + y}{(x - y)^2} \times \frac{x - y}{x + xy + y^2}$$

11. Simplify:
$$\frac{2x^2 + x - 1}{x^2 - 4x + 3} \times \frac{2x^2 - 5x + 3}{6x^2 + x - 2} \times \frac{3x^2 - 7x - 6}{2x^2 - 7x + 6}$$

3.7. MULTIPLICATION PROPERTIES OF RATIONAL EXPRESSIONS

Let us discuss multiplication properties of rational expressions. We can easily verify them from what we have discussed so far.

(1) For any two rational expressions $\frac{p(x)}{a(x)}$ and $\frac{r(x)}{s(x)}$,

$$\frac{p(x)}{q(x)} \times \frac{r(x)}{s(x)}$$
 is also a rational expression.

We say that rational expressions are closed under multiplication.

(2) For any two rational expressions $\frac{p(x)}{a(x)}$ and $\frac{r(x)}{s(x)}$,

$$\frac{p(x)}{q(x)} \times \frac{r(x)}{s(x)} = \frac{r(x)}{s(x)} \times \frac{p(x)}{q(x)}$$

We say that multiplication of rational expressions is commutative.

(3) For any three rational expressions $\frac{p(x)}{q(x)}$, $\frac{r(x)}{s(x)}$ and $\frac{u(x)}{v(x)}$.

$$\left[\frac{p(x)}{q(x)} \times \frac{r(x)}{s(x)}\right] \times \frac{u(x)}{v(x)} = \frac{p'(x)}{q(x)} \times \left[\frac{r(x)}{s(x)} \times \frac{u(x)}{v(x)}\right].$$

We say that multiplication of rational expressions is associative.

(4) For any rational expression $\frac{p(x)}{q(x)}$,

$$\frac{p(x)}{q(x)} \times \frac{1}{1} = \frac{p(x)}{q(x)}.$$

We say that rational expression $\frac{1}{1}$ i.e., 1 is the multiplicative identity for rational expressions.

(5) For any rational expression $\frac{p(x)}{q(x)}$,

$$\frac{p(x)}{q(x)} \times \frac{0}{1} = \frac{p(x) \cdot 0}{q(x) \cdot 1} = \frac{0}{q(x)}$$

The product of any rational expression with zero rational expression is the zero rational expression.

(6) For any non-zero rational expression $\frac{p(x)}{q(x)}$, there exists another rational expression

 $\frac{p(x)}{q(x)} \times \frac{q(x)}{p(x)} = 1$ $\frac{q(x)}{p(x)}$ such that

We say that $\frac{q(x)}{p(x)}$ is the multiplicative inverse or reciprocal of $\frac{p(x)}{q(x)}$.

Observe that the product of a rational expression with its reciprocal in lowest terms is always 1.

Now we can define division of a rational expression by a non-zero rational expression. If $\frac{p(x)}{q(x)}$ and $\frac{r(x)}{s(x)}$ are rational expressions and $\frac{r(x)}{s(x)} \neq 0$, then we define

$$\frac{p(x)}{q(x)} \cdot \frac{r(x)}{s(x)} \text{ as } \frac{p(x)}{q(x)} \times \frac{s(x)}{r(x)} \text{ i.e., } \frac{p(x) \cdot s(x)}{q(x) \cdot r(x)}.$$

Thus, division of a rational expression by a non-zero rational expression is same as multiplying the dividend by the reciprocal of the divisor.

Example 9. Divide
$$\frac{x^2-1}{x+2}$$
 by $\frac{(x+1)^2}{x^2+5x+6}$.
Solution. $\frac{x^2-1}{x+2} \div \frac{(x+1)^2}{x^2+5x+6} = \frac{x^2-1}{x+2} \times \frac{x^2+5x+6}{(x+1)^2}$

$$= \frac{(x+1)(x-1)}{(x+2)} \times \frac{(x+2)(x+3)}{(x+1)^2}$$

$$= \frac{(x+1)(x-1)(x+2)(x+3)}{(x+2)(x+1)^2}$$

$$= \frac{(x-1)(x+3)}{x+1}$$

$$= \frac{x^2+2x-3}{x+1}$$

EXERCISE 3 (g)

(Section A)

- 1. What is the multiplicative identity of the rational expression $\frac{p(x)}{q(x)}$?
- 2. What is the multiplicative inverse of the rational expression $\frac{p(x)}{q(x)}$?

What is the restriction on p(x) so that $\frac{p(x)}{q(x)}$ may have a multiplicative inverse?

3. Find the reciprocals of the following:

(a)
$$\frac{1}{x^2}$$
, (b) $\frac{x+1}{x-1}$,

(c)
$$\frac{x^2+x+1}{x-1}$$
.

4. Divide
$$\frac{x+4}{x-1}$$
 by $\frac{x+2}{x-3}$.

5. Divide
$$\frac{x^2+1}{x-2}$$
 by $\frac{x^2+1}{x+2}$.

(Section B)

Express the following as rational expressions in lowest terms:

6.
$$\frac{x^2-36}{x^2-49} = \frac{x+6}{x+7}$$

7.
$$\frac{x^2 + xy}{x - y} \div \frac{xy}{x^2 - y^2}$$

8.
$$\frac{4x^2-12x+9}{(2x-3)^2} \div (2x-3).$$

9.
$$\frac{x^2-8x-9}{x^2-17x+72} \cdot \frac{x^2-1}{x^2-25}$$

10.
$$\frac{x^2+8x+12}{x^2-7x+12} = \frac{x^2+4x-12}{x-4}$$
.

(Section C)

11. Simplify:
$$\left(\frac{2x^2+3}{x-1} + \frac{x+3}{x+1}\right) \div \frac{x^2-1}{3x}$$
.

12. Simplify:
$$\left(\frac{x^3-8}{x^2+4x+4} \times \frac{x+3}{x^2-4}\right) \cdot \frac{x^2+2x+4}{x^2+3x+2}$$
.

3.8. You have learnt properties of rational expressions. You now recall properties of rational numbers. Compare properties of rational numbers with those of rational expressions.

What do you observe?

We find that algebra of rational expressions is analogous to that of rational numbers. So, we say that rational expressions behave like rational numbers.

We have used several identities proved for rational numbers. These identities will also be true for rational expressions. So, we can write special products and factorisation for rational expressions.

If R and S are two rational expressions, then the following results or statements will be very helpful to you in solving problems:

(1)
$$(R+S)^2 = R^2 + 2RS + S^2$$

(2)
$$(R-S)^2 = R^2 - 2RS + S^2$$

(3)
$$(R+S)(R-S)=R^2-S^2$$

(4)
$$(R+S)^3 = R^3 + S^3 + 3RS(R+S)$$

(5)
$$(R-S)^3 = R^3 - S^3 - 3RS(R-S)$$

(6)
$$R^3+S^3=(R+S)(R^2-RS+S^2)$$

(7)
$$R^3 - S^3 = (R - S)(R^2 + RS + S^2)$$

REVIEW EXERCISE III

(Section A)

- 1. Fill in the blanks to make the following statements true:
 - (a) Polynomials behave like......
 - (b) Every rational number is also a.....expression.
 - (c) Rational expressions areunder addition.
 - (d) Multiplication of rational expressions is and associative.
 - (e) Addition of rational expressions is.....and commutative.
 - (f) The product of a non-zero rational expression and its reciprocal is always.......
- 2. Find the additive inverse of $\frac{5-x}{x^2+2}$.
- 3. Find the reciprocal of $\frac{x^2+1}{x-1}$.

(Section B)

- 4. Reduce the rational expression $\frac{(x-3)(x^2-5x+4)}{(x-1)(x^2-2x-3)}$ to its lowest terms.
- 5. Find the sum of $\frac{x^2+1}{x^2-1}$ and $\frac{x+1}{x+2}$
- 6. Which rational expression should be added to $\frac{x^3-1}{x^2+2}$ to get $\frac{2x^3-x^2+3}{x^2+2}$?
- 7. Find the product of $\frac{x^2-7x+10}{(x-4)^2}$ and $\frac{x^2-7x+12}{x-5}$.
- 8. Divide $\frac{x^2-1}{x+3}$ by $\frac{x^2+2x+3}{x-7}$.

(Section C)

9. Simplify:
$$\frac{1}{a-1} - \frac{a}{a^2-1} - \frac{a^2}{a^4-1} - \frac{a^4}{a^8-1}$$

10. Simplify:
$$\frac{x^3-a^3}{x^2-2bx+b^2} \times \frac{x^2-bx-cx+bc}{ax-x^2} - \frac{x^2-cx}{x-b}$$
.

11. Simplify:
$$\left(\frac{x+3}{x+2} \times \frac{x^2-1}{x+6}\right) - \left(\frac{x^2+7}{2} - \frac{x^2+3}{x} \times \frac{4x}{3}\right)$$

MENSURATION (Plane Figures)

41. REVIEW

Mensuration is the science of measurement. It deals with determining lengths, breadths, areas and volumes of plane figures and solids. You have learnt to find area of plane figures in the earlier classes. Let us recall those results.

1. Rectangles.

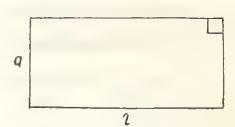

- (a) Perimeter of a rectangle=2(l+b)
- (b) Area of a rectangle, $A=l\times b$
- (c) Length of a rectangle = $\frac{A}{b}$
- (d) Breadth of a rectangle = $\frac{A}{I}$
- (e) Diagonal of a rectangle $= \sqrt{(l^2 + b^2)}$

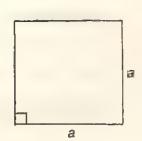

2. Squares.

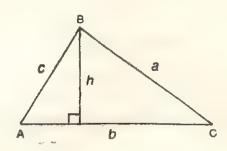

- (a) Perimeter of a square, p=4a
- (b) Side of a square $=\frac{p}{4}$
- (c) Area of a square, $A=a^2$
- (d) Side of a square $=\sqrt{A}$
- (e) Diagonal of a square $=a\sqrt{2}$

3. Triangles.

- (a) Semi-perimeter of a triangle, $s = \frac{a+b+c}{2}$
- (b) Area of a triangle = $\frac{1}{2}$ bh
- (c) Area of a triangle $= \sqrt{s(s-a)(s-b)(s-c)}$

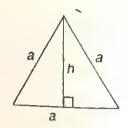

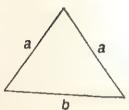

(d) Area of an equilateral triangle $= \frac{\sqrt{3}}{4} a^2$

Altitude of an equilateral triangle, $h = \frac{\sqrt{3}}{2} a$

(e) Perimeter of an isosceles triangle, p=a+b+a

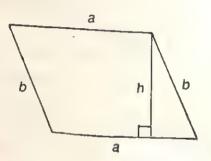

Area of an isosceles triangle, $= \frac{a}{4} \sqrt{4b^2 - a^2}$

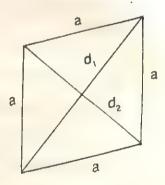

4. Parallelograms.

- (a) Perimeter of a parallelogram, p=2 (a+b)
- (b) Area of a parallelogram, A=ah
- (c) Base of a parallelogram $=\frac{A}{h}$
- (d) Height of a parallelogram $=\frac{A}{a}$

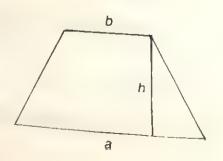

5. Rhombuses.

- (a) Perimeter of a rhombus, p=4a
- (b) Area of a rhombus, $A = \frac{1}{2} d_1 d_2$
- (c) Side of a rhombus, $a = \frac{1}{2} \sqrt{(d_1^2 + d_2^2)}$

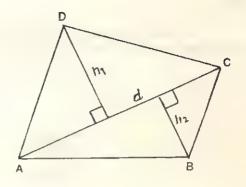

6. Trapeziums.

- (a) Area of a trapezium, $A = \frac{1}{2}(a+b)h$
- (b) Height of a trapezium, $h = \frac{2A}{a+b}$

7. Quadrilaterals.

Area of a quadrilateral, $A = \frac{1}{2} (h_1 + h_2) d$

EXERCISE 4 (a)

- 1. Find the least number of square slabs of equal size that will cover the floor of a hall which is 18 metres long and 14 metres broad.
- 2. If the length of a rectangle is decreased by 5 metres, and its breadth increased by two metres, it becomes a square whose area is 65 sq. metres less than that of the original rectangle. Find the dimensions of the rectangle.
- 3. A garden consists of a rectangular plot of grass surrounded by a border 3 metres wide, the whole being 40 metres long and 24 metres wide. In the central part are three rectangular flower-beds each 4 metres long and 3 metres wide. What percentage of the whole area is grass-covered?
- 4. The sides of a triangular field are 1,022 metres, 1,095 metres and 949 metres. It is let out at Rs. 100 per hectare. Find the rent.
- 5. A plot of ground is in the form of an isosceles triangle. If it costs Rs. 1,000 at the rate of Rs. 2'50 per square metre, and if each of the equal sides measures 40 metres, find the length of the base.
- 6. Find the base of an isosceles triangle whose area is 60 cm² and the length of one of its equal sides is 13 cm.
- 7. The perimeter of a rhombus is 146 cm and one of its diagonals is 55 cm. Find the other diagonal and area of the rhombus.
- 8. A trapezium with parallel sides of length as 7:3 is cut from a rectangle 30 dm by 4 dm so as to have an area of one-third the latter. Find the lengths of the parallel sides.
- 9. The length and breadth of a room are in the ratio of 3:2. Its height is equal to ½ of its length. The cost of carpeting the floor at Rs. 4 per sq. metre is Rs. 216. Find the cost of papering the walls at Rs. 3.20 per square metre.
- 10. The perimeter of a right triangle is p. Its hypotenuse is d. Find the other two sides and the area of the triangle. Taking p=12 cm and d=5 cm, solve the problem.

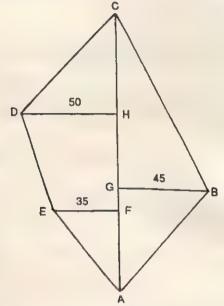

42. AREAS OF IRREGULAR FIGURES

When a Tehsildar goes to check measurements of land in a village, he does not often come across fields whose shapes are rectangles, squares or right-angled triangles. He has to measure *irregular polygons*. To find the area of such polygons, we divide the figure into small rectangles, trapeziums and right-angled triangles. We, then, can find the area of each of the regular figures so formed. Adding all these areas, we get the area of the irregular polygon.

A land surveyor records the various measurements such as lengths of the offsets and the distances along the base line in a field book, in the following form:

	Metres	
	To C	
To D 50	140 90	
10 10 30	50	45 To B
To E 35	40	42 TO B
	From A	
		-

Let us first draw the figure. Note that the field book is read from the bottom upwards.

Taking a suitable scale, 20 m=1 cm, we draw base line AC=140 m. AF=40 m on AC and draw offsect FE=35 m to the left. Measure

Measure AG=50 m on AC and draw offset GB=45 m to the right.

Measure AH=90 m on AC and draw offset HD=50 m to the left.

Then by joining A, B, C, D, E and A, we get the polygon ABCDE.

=Area of $\triangle ABG$ +Area of $\triangle GBC$ +Area of $\triangle HCD$ +Area of trap. FHDE

Area of right-angled
$$\triangle ABG = \frac{1}{3} \times AG \times GB$$
 $+ Area of trap. FHDE$ $+ Area of \triangle AFE.$

Area of right-angled $\triangle GBC = \frac{1}{2} \times GC \times GB$ $= \frac{1}{2} \times 90 \times 45 \text{ sq. } m$ $= 2025 \text{ } m^2$

Area of right-angled $\triangle HCD = \frac{1}{2} \times HC \times HD$ $= \frac{1}{2} \times 50 \times 50 \text{ sq. } m$ $= 1250 \text{ } m^2$ $[HC = AC - AH = (140 - 90) \text{ } m = 50 \text{ } m]$

Area of trap.
$$FHDE$$
 =\frac{1}{3} (FE+HD)\times FH [FH=AH-AF=(90-40) m = 50 m]
=\frac{1}{2} (35+50)\times 50 sq. m
=2125 m²

Area of right-angled $\triangle AFE = \frac{1}{2} \times AF \times FE$ $=1\times40\times35$ sq. m $=700 m^2$

... Area of pentagonal field ABCDE

$$=1125 m^2 + 2025 m^2 + 1250 m^2 + 2125 m^2$$
$$=7225 m^2.$$

EXERCISE 4 (b)

(Section A)

1. Find the area of a pentagonal field, given the following data in a land surveyor's field book:

	Metres	
To D 20 To E 30	To C 150 120 80 50 From A	То В

50

2. Find the area of a pentagonal field, given the following measurements in a land surveyor's field book:

(Section B)

From the given measurements of the fields, draw figures of appropriate scale and find their areas:

3.	Metres		4.	Metres	
To E 25 To F 20	100 80 70 40 30 From A	To C 40 To B 30	To E 60 To F 20	To D 550 410 320 200 110 From A	To C 50

(Section C)

The measurements of fields are noted as follows by a surveyor in his field book. Draw the plan of the fields according to suitable scale and find their areas:

5.	Metres	6. , . ;	Metres	
To F 230 To G 340	To E 1000 840 700 610 560 310 From A	To D 60 To C 800 To B 220 To G 140 To F 150 To E 50	To A 600 540 480 470 380 100 From D	To B 100 To C 150
то G 340	610 560 310	To C 800	470 380 100	

4.3. CIRCLES

You know how to draw a circle when its centre and radius are specified. You also know that the perimeter of a circle is called its circumference.

If A and C denote the area and circumference respectively of a circle of radius r, then $A = \pi r^2$; $C = 2\pi r$.

You know that the circumference of a circle bears a constant ratio to its diameter. This constant ratio is denoted by the Greek letter π , pronounced 'pi'. It stands for an irrational number whose value is given approximately to two decimal places by 3.14 or by the fraction $\frac{22}{7}$. Upto four decimal places, its approximate value is 3.1416. But for calculation purposes an approximate value of π is taken as $\frac{22}{7}$ or 3.14.

EXERCISE 4 (c)

- 1. A wire is in the form of a circle of radius 42 cm. Determine the sides of the square into which it can be bent. $\left(\text{Use }\pi = \frac{22}{7}\right)$ [C.B.S.E., 1977 (Delhi)]
- 2. What is the area of the circle, the circumference of which is equal to the perimeter of a square of side 11 cm?
- 3. From a copper plate which is a square of side 12.5 cm, circular disc of diameter 7 cm is cut off. Find the weight of the remaining part, if 1 sq. cm of the plate weighs 0.8 gram. (Assume $\pi = \frac{22}{7}$)

 [C.B S.E., 1980 (Delhi)]
- 4. The outer circumference of a circular race track is 528 m. The track is everywhere 14 m wide. Calculate the cost of levelling the track at the rate of 50 paise per sq. m.

 [C.B.S.E., 1982 (Delhi)]
- 5. The inner circumference of a circular track is 440 m. The track is 14 m wide. Calculate the cost of (a) levelling the track at the rate of 20 paise per sq. m (b) putting up fence along outer circle at Rs. 2 per m. $\left(\text{Use } \pi = \frac{22}{7}\right)$
- 6. A playground has the shape of a rectangle, with two semi-circles on its smaller sides as find the area of the playground.

 If the sides of the rectangle are 36 m and 24.5 m,

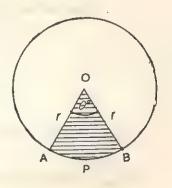

- 7. A piece of wire that has been bent into the form of a semi-circle, including the bounding diameter, is straightened and then bent into the form of a square. The diameter of the circle is 12 cm long. Which area is larger, the semi-circle or the square? By how much?
- 8. The cost of turfing a uniform circular road round a circular garden at 20 P per sq. metre is Rs. 215.60 and the area of the garden is 1,386 sq. metres. Find the breadth of the circular road.
- 9. Four circular coins, each of radius 1'4 cm, are placed flat on a table such that their centres are the corners of a square and that each coin touches two of the others. Calculate the area lying vacant between their rims.
- 10. A boy is cycling such that the wheels of the cycle are making 140 revolutions per minute. If the diameter of the wheel is 60 cm, calculate the speed per hour with which the boy is cycling.
- 11. A circular field has a perimeter of 660 m. A plot in the shape of a square having its vertices on the circumference of the field is marked in the field. Calculate the area of the square plot.

44. SECTOR

The shaded region shown on the right is a part of the circular region with centre O and radius r. The shaded region OAPB is called a **sector** of the circle. Its boundary consists of arc APB and two radii OA and OB. This sector has an angle θ , subtended at the centre of the circle.

The region bounded by two radii of a circle and the arc intercepted by them is called the sector of the circle.

When $\theta < 180^{\circ}$, arc AB is a minor arc. When θ is increased to 180° , arc AB increases proportionally, to the size of a semi-circular arc of length πr . So, half the circumference of a circle *i.e.*, πr subtends an angle of 180° at the centre of the circle.

Thus, for sector AOB with $\angle AOB = \theta^{\circ}$, the length of minor arc AB is $\frac{\theta}{180} \times \pi r$ i.e, $\frac{\pi r \theta}{180}$

$$1=\frac{\pi r \theta}{180}$$

Observe that the area of a sector is proportional to the angle of the sector. When the arc subtends an angle of 180° at the centre, the area of the corresponding sector is $\frac{1}{2}$ (area of the circle) i.e. $\frac{1}{2}\pi r^2$.

Thus, for sector AOB with $\angle AOB = \theta^{\circ}$, the area of the sector is $\frac{\theta}{180} \times \frac{1}{2}\pi r^2$ i.e., $\frac{\pi r^2 \theta}{360}$

$$A = \frac{\pi r^2 \theta}{360}.$$

Area can also be expressed in terms of l.

$$A = \frac{\pi r^2 \theta}{360} \qquad \qquad = \frac{\pi r \theta}{180} \times \frac{r}{2} \qquad \qquad = l \times \frac{r}{2}$$
$$A = \frac{1}{2} lr$$

Example 1. In a circle of radius 3.5 cm, find the perimeter of a sector with central angle 36°.

Solution. Here
$$\theta = 36^{\circ}$$
, $r = 3.5 \text{ cm}$
Length of the arc, $l = \frac{\pi r \theta}{180}$

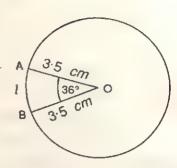

$$= \frac{\frac{\pi^2}{180} \times 3.5 \times 36}{180} \text{ cm}$$

$$= \frac{22 \times 3.5 \times 36}{7 \times 180} \text{ cm}$$

$$= 2.2 \text{ cm}$$

Perimeter of the sector=
$$r+l+r$$

=(3.5+2.2+3.5) cm
=9.2 cm.

Example 2. Find the area of a sector of a circle whose radius is 6 dm and central angle is 105°.

Solution. Here
$$\theta=105^{\circ}$$
, r

Area of a sector
$$=\frac{\pi r^2 \theta}{360}$$

$$\therefore \text{ Area of the given sector} = \frac{22}{7} \times \frac{6 \times 6 \times 105}{360} dm^2$$

$$= \frac{22 \times 105}{7 \times 10} dm^2$$

$$= 33 dm^2$$

(Section A)

- 1. In a circle with [radius 21 cm. Find the length of the arc of a sector with central angle 60°.
- 2. In a circle of radius 3.5 cm, find the area of the sector whose angle measures 36°. $\left(\text{Take } \pi = \frac{22}{7}\right)$
- 3. Find the area of a sector of a circle whose radius is 8 cm and the length of the arc is 15 cm.
- 4. Find the area of a sector of a circle whose radius is 6 metres and central angle is 42°.

(Section B)

- 5. The length of the minute hand of a wall clock is 10.5 om. Find the area swept by the minute hand in 10 minutes time. $\left(\text{Use } \pi = \frac{22}{7}\right)$
- 6. Given a circle with radius 3.6 cm. Find the perimeter and area of its sector with central angle 36°. $\left(U_{\text{Se}} \pi = \frac{22}{7}\right)$
- 7. The area of a sector is $\frac{1}{10}$ that of the whole circle. Find the angle of the sector.
- 8. From a circular piece of card-board of radius 3 cm two sectors with central angle of 40° each have been cut off. Find the area of the remaining portion.

(Section C)

- 9. A circular disc of 4 cm in radius is divided into three sectors with central angles 110°, 150° and 100°. What part of the whole disc is the sector with the central angle 150°?
- 10. A circular disc of 6 cm in radius is divided into three sectors with central angles 120°, 150°, 90°. What part of the whole area is the sector with central angle 120°? Also give the ratio of the areas of the sectors.

 [C.B.S.E., 1977 (A.I)]

4.5. SEGMENT OF A CIRCLE

The drawing on the right shows a circle with centre O and radius r.

Let chord AB divide the circle into two segments ACB and ADB.

The segment ACB which is less than the semi-circle, is called the **minor segment**. The segment ADB which is greater than the semi-circle, is called the **major segment**.

Join OA and OB. Let $\angle AOB$ be θ° .

Let us now find the area of the minor segment shown by shaded region.

Area of the minor segment ACB

=Area of sector
$$OACB$$
-Area of $\triangle AOB$.

Then, area of the major segment ADB

=Area of the circle-Area of minor segment ACB.

Example 3. The radius of a circle is 7 cm and the angle of the sector is 60°. Find the area of the minor segment.

Solution. Here
$$r=7$$
 cm, $\theta=60^{\circ}$

Area of sector
$$OACB = \frac{\pi r^2 \theta}{360}$$

 $= \frac{22 \times 7 \times 7 \times 60}{7 \times 360} \text{ cm}^2$
 $= \frac{77}{3} \text{ cm}^2 = 25.667 \text{ cm}^2$

Area of △AOB

$$= \frac{77}{3} \text{ cm}^2 = 25.667 \text{ cm}^2$$

$$= \frac{\sqrt{3}}{4} a^2 \qquad [\triangle AOB \text{ is equilateral}]$$

$$= \frac{\sqrt{3} \times 7 \times 7}{4} \text{ cm}^2$$

$$= \frac{\sqrt{3} \times 7 \times 7}{4} \text{ cm}^2$$

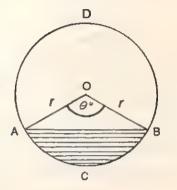

$$= \frac{49 \times 1.732}{4} \text{ cm}^2$$
$$= 21.217 \text{ cm}^2$$

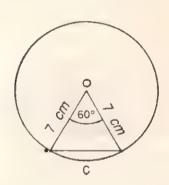

=Area of the sector
$$OACB$$
—Area of the $\triangle AOB$
=25.667 cm²—21.217 cm² =4.45 cm².

EXERCISE 4 (e)

- 1. A chord AB of a circle of radius 15 cm makes an angle of 60° at the centre of the circle. Find the area of the minor segment. (Take $\pi=3.14$, $\sqrt{3}=1.73$).
- 2. The radius of a circle with centre O is 5 cm. Two radii OA and OB are drawn at right angles to each other. Find the area of the two segments made by the chord BA. (Take $\pi=3^{\circ}14$).
- 3. Find the area of the minor segment of a circle, given that the angle of the sector is 120° and the radius of the circle is 21 cm. (Take $\pi = 3.1416$).
- 4. A chord AB of a circle of radius 10 cm makes a right angle at the centre of the circle. Find the area of the major and the minor segments. (Take $\pi = 3.14$).

MENSURATION—SOLIDS

51. SOLIDS

In the previous chapter you learnt about methods for finding areas of plane figures like rectangles, triangles, polygons, circles, sectors and segments. We shall now discuss solids. We see everyday solic's like a brick, a book, a pencil, a match-box, a tennis ball, sugar cubes, tanks, etc. These are different kinds of solids.

A plane figure lies entirely in a plane where as a solid does not. Solids lie in space. Plane figures are two dimensional and they have length and breadth only. But solids are three dimensional and they have length, breadth and height or thickness.

Usually we see the outside of a solid; all the outside is called the surface. Some solids like bricks have plane surfaces, other like tennis balls have curved surfaces.

The amount of space enclosed by the bounding surface or surfaces of a solid is called the volume of the solid.

As with area we need a standard unit of volume.

The unit of measurement of volume is unit cube. It is a cube with 1 cm sides. Its volume is 1 cubic centimetre or 1 cm³.

We give below various units of volume depending upon the unit of measure.

1000 cubic millimetres=1 cubic centimetre (cubic cm)
1000 cubic centimetres =1 cubic decimetre (cubic dm)
1000 cubic decimetres =1 cubic metre (cubic m)
1000 cubic metres =1 cubic decametre (cubic dam)
1000 cubic decametres =1 cubic hectometre (cubic hm)
1000 cubic hectometres =1 cubic kilometre (cubic km)

5'2. CUBOID

Shoe-boxes, chalk-boxes, match-boxes, packets of surf washing powder, water tub, etc., are examples of cuboids.

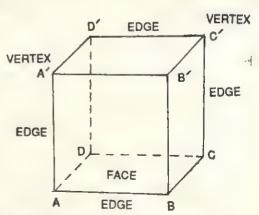

A solid bounded by six rectangular surfaces is called a cuboid or a rectangular prism.

A cuboid is also called a rectangular paral- VERTEX lelopiped.

The dimensions of a cuboid are length, breadth and height.

A cuboid has six faces, each one being a rectangle. Opposite faces are parallel and congruent. There are three pairs of parallel faces. Two adjacent faces meet along a line segment called an edge.

A cuboid has twelve edges. Opposite edges are parallel and equal in length. There are six pairs of parallel edges. Three mutually perpendicular edges meet at a point called a vertex,

A cuboid has eight vertices.

Thus, a cuboid has six faces, twelve edges and eight vertices.

Note that three faces and three edges meet at each vertex.

In the adjoining figure, the faces are rectangles ABCD, A'B'C'D', AA'B'B, BB'C'C, CC'D'D and DD'A'A. The sum of the areas of these six faces is the total surface area of the cuboid.

Its edges are AA', BB', CC', DD', AB, A'B', BC, B'C' CD, C'D', AD and AD'. It is easily seen that

$$AB=A'B'=CD=C'D'=l$$
 (length)
 $BC=B'C'=AD=A'D'=b$ (breadth)
 $AA'=BB'=CC'=DD'=h$ (height)

and

Its vertices are A, B, C, D, A', B', C' and D'.

Volume of a cuboid

=length × breadth × height

Using l, b and h for length, breadth and height of a cuboid and V for its volume, we have

$$V = 1 \times b \times h$$

From this formula, we get the following:

$$(i) \quad l = \frac{V}{b \times h}$$

(ii)
$$b = \frac{V}{l \times h}$$

$$(iii) h = \frac{V}{l \times b}$$

The total surface area of a cuboid is the sum of the areas of its six faces.

Total surface area of a cuboid=2(lb+bh+lh)

Diagonal of a cuboid

 $= \sqrt{(l^2 + b^2 + h^2)}$

Note that these formulae are true also when I, b and h are any real numbers.

Example 1. A rectangular tank measuring internally 37 m in length, 12 m in breadth and 8 m in depth, is full of water. Find the weight of water in metric tonnes, given that one cubic metre of water weighs 1,000 kg.

Solution. Length of the tank=37 m

Breadth of the tank=12 m

Depth of the tank=8 m

Volume of the tank=37×12×8 cubic metres

Volume of water in tank=37×12×8 cubic m

=3552 cubic m

Weight of 1 cubic metre of water=1000 kg Weight of water in the tank=3552×1000 kg

=3552000 kg

=3552 metric tonnes.

Example 2. A box with a lid is made of planking 2.5 cm thick. If its external dimensions be 1 m, 85 cm and 65 cm, how many square metres of planking are used in the construction?

Solution. External dimensions of the box:

length=1 m=100 cm; breadth=85 cm; height=65 cm

External volume of the box= $100 \times 85 \times 65$ cm³

 $=5,52,500 \text{ cm}^3$

Internal dimensions of the box:

Length=100 cm-2×2·5 cm
$$=(100-5)$$
 cm=95 cm $=(85-5)$ cm=80 cm $=(85-5)$ cm=80 cm $=(65-5)$ cm=60 cm $=(65-5$

EXERCISE 5 (a)

(Section A)

- 1. Find the volume and surface of a cuboid whose dimensions are 36 m, 12 m and 1 m.
- 2. Find in litres of cubic contents of a tank 2.8 metres long, 1.4 metres wide, and 0.75 metre deep.
- 3. The area of a playground is 4800 sq. m. Find the cost of covering it with gravel 1 cm deep, if the gravel costs Rs. 4'80 per cubic metre.
- 4. The outer measurements of a closed wooden box are 42 cm, 30 cm and 27 cm. If the box is made of wood, 1 cm thick, determine the capacity of the box.
- 5. The length and breadth of a rectangular solid are respectively 25 cm and 20 cm. If the volume is 7000 cm³, find its height.
- 6. A brick measures 20 cm by 10 cm by 7.5 cm. How many bricks will be required for a wall 25 cm long, 2 m high and 75 cm thick?
- 7. If 72 cubic metres of sand be thrown into a tank 12 metres long and 5 metres wide, find how much the water will rise.

(Section B)

- 8. A tank 8 metres long, 5 metres wide, contains 800 quintals of water. Find its depth if 1 cubic metre of water weighs 10 quintals.
- 9. A closed tea chest is 47 cm long, 47 cm wide and 60 cm deep, by internal measurement. Find in square metres the total area of tinfoil needed for lining it.
- 10. The areas of three adjacent faces of a cuboid are x, y and z. If the volume is V, prove that $V^2 = xyz$. [C.B.S.E., 1982(A.I.)]
- 11. A rectangular box whose external dimensions including the lid are 32, 27, 12 decimetres is made of wood '5 dm in thickness. What is the volume of wood in it?
- 12. The annual rainfall at a place is 43 cm. Find the weight in metric tonnes of the annual rain falling there on a hectare of land, taking the weight of water to be 1 metric tonne to the cubic metre.
- 13. A cubic metre of gold is extended by hammering so as to cover an area of 2 hectares. Find the thickness of the gold in decimals of a cm, correct to the first two significant figures.
- 14. A rectangular tank is 3.5 m long, 1.8 m broad and 1.5 m deep. Calculate in litres the amount of water it will hold. If 700 litres of water are drawn off, find to the nearest mm, how much the water level sinks?
- 15. A stream which flows at a uniform rate of 2 5 km an hour, is 20 metres wide, the depth of a certain ferry being 1.2 metres. How many litres pass the ferry in a minute?

- 16. The length, breadth and height of a rectangular solid are in the ratio of 5:4:2. If the total surface area is 1216 cm², find the length, breadth and height of the solid.
- 17. The volume of a rectangular solid is 576 cubic cm and the length of a diagonal is $\sqrt{244}$ cm. If its thickness be 6 cm, find its length and breadth.

(Section C)

- 18. A field is 30 m long and 18 m broad. A pit, 6 m long, 4 m wide and 3 m deep, is dug out from the middle of the field and the earth removed is evenly spread over the remaining area of the field. Find the rise in the level of the remaining part of the field in centimetres correct to one decimal place.
- 19. What depth of trench 9 dm wide must be dug round a plot 180 dm wide and 240 dm long in order that the earth removed may be sufficient to raise the level of the whole plot by 3 cm?
- 20. A closed cistern, 75 cm long, 28 cm wide (external measurements), is made of metal 15 mm thick and has a capacity of 27 litres. Find the external height.

5'3. CUBES

When the dimensions of a retangular solid are equal to one another, it is called a cube. In case of a cube, l=b=h

Then
$$V = l \times l \times l$$
 = l^3

The volume of a cube with a side of l units is l^3 .

In symbols,
$$V=l^3$$

The edge of a cube, $l=\sqrt[3]{V}$

Total surface area of a cube
$$=2(l\times l+l\times l+l\times l)$$
$$=2(l^2+l^2+l^2)$$
$$=6l^2$$

Example 3. Three cubes of metal whose edges are 3 cm, 4 cm, and 5 cm respectively, are melted down and formed into a single cube. Find the edge of the new cube.

Solution. Edge of the first cube=3 cm

Edge of the second cube =4 cm

... Volume of the second cube =48 cm³ =64 cm³

Edge of the third cube =5 cm

:. Volume of the third cube = 5³ cm³ = 125 cm³

Then volume of the new cube =(27+64+125) cm³

 $=216 \text{ cm}^3$

Therefore, edge of the new cube = $\sqrt[3]{216}$ cm

 $=\sqrt[3]{6\times6\times6}$ cm =6 cm.

EXERCISE 5 (b)

(Section A)

- 1. Find the volume and surface of a cube whose edge is 15 cm?
- 2. The length of the edge of a cube is 4 cm. Find (i) the total surface area of the cube, (ii) the volume of the cube.
- 3. The perimeter of one face of a cube is 20 cm. Find (i) the total area of six faces, (ii) the volume of the cube.
- 4. What number of 4 cm cubes can be cut from a 12 cm cube?

- 5. Two cubes each or side 12 cm are joined end to end. Find the surface area of the resulting cuboid.
- 6. The surface of a cube is 726 dm². Find its volume.
- 7. A cubical block of stone contains 5,832 cubic cm. Find the length of its side.

(Section B)

- 8. Find the edge of a cube whose surface has the same area as that of a rectangular solid which is 10 dm long, 7 dm broad and 6 dm thick.
- 9. The three co-terminus edges of a rectangular solid are 36, 75 and 80 cm respectively. Find the edge of a cube which will be of the same capacity.
- 10. The internal measurements of a box are 20 cm long, 16 cm wide and 24 cm high. How many 4 cm cubes could be put into the box?
- 11. Three cubes whose edges are 6 cm, 8 cm and 10 cm respectively are melted without any loss of metal into a single cube. Find the surface area of the new cube.
- 12. Two cubes, each with 12 cm edge, are joined end to end. Find the surface area of the resulting cuboid.

 [C.B.S.E., 1978 (Delhi)]

(Section C)

- 13. A cube whose edge is 20 cm long has a circle 20 cm diameter on each of its faces painted black. What is the total area of the unpainted surface of the cube.
- 14. A rectangular container whose base is a square of side 6 cm, stands on a horizontal table and holds water upto 1 cm from the top. When a cube is placed in the water and is completely submerged, the water rises to the top and 2 cm³ of water overflows. Calculate the volume of the cube and the length of its edge.

54. CYLINDER

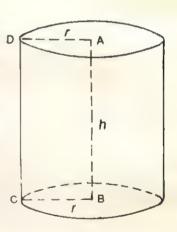

Observe a ruler, an ordinary lead pencil, a stone roadroller, a water pipe or a circular pillar. Each of these objects has a shape of a cylinder.

A cylinder has a curved surface, two equal circular ends and two equal edges.

The line segment joining the centres of the two circular ends is called the axis of the cylinder.

If the axis of the cylinder is perpendicular to the circular ends, then the cylinder is called a right circular cylinder.

In the figure, AB is the axis and BC or AD is the radius of the cylinder. The length of the axis is called the **height** of the cylinder.

A right circular cylinder is generally defined as the solid generated by the revolution of a rectangle about one of its sides.

The length of the side AB about which the rectangle ABCD is rotated, is the **height** of the cylinder. The length of the other side BC is the **radius** of the cylinder.

We state the following formulae for a cylinder with radius r and height h:

Volume of a right circular cylinder = $\pi r^2 h$

Curved surface of a right circular cylinder=2nrh

Whole surface of a right circular cylinder=curved surface+2×(area of the end)

$$=2\pi rh + 2\pi r^2 = 2\pi r(h+r)$$

Observe that the cross-section of a right circular cylinder by a plane parallel to the base is a circle.

Example 4. Find the volume of a right cylinder which has a height of 14 dm and a base of radius 3 dm. Also find the curved surface of the cylinder.

Solution. Radius of the base (r)=3 dmHeight of the cylinder (h)=14 dmVolume of a right circular cylinder $=\pi r^2 h$ Volume of the given cylinder $=\frac{22}{\pi} \times 3 \times 3 \times 14 \text{ dm}$

Volume of the given cylinder $= \frac{22}{7} \times 3 \times 3 \times 14 \text{ dm}^3$ = 396 cubic dm

Curved surface of a right circular cylinder

Curved surface of the given cylinder $= 2 \times \frac{22}{7} \times 3 \times 14 \text{ sq. dm}$ = 264 sq. dm

Example 5. Find the weight of a lead pipe 3.5 metres long. The external diameter of the pipe is 2.4 cm and the thickness of the lead is 2 mm and 1 cm³ of lead weighs 11.4 grams.

Solution. External radius of the pipe = $\frac{2.4}{2}$ cm=1.2 cm

Length of the pipe (h)=3.5 m = 350 cm Volume of a right circular cylinder = $\pi r^2 h$

External volume of the pipe $= \frac{22}{7} \times 1.2 \times 1.2 \times 350 \text{ cubic cm}$

 $=1584 \text{ cm}^3$

Thickness of the pipe=2 mm =0.2 m

Internal radius of the pipe =1.2 cm-0.2 cm=1 cm

Internal volume of the pipe $=\pi R^2 h$

 $= \frac{22}{7} \times 1 \times 1 \times 350 \text{ cm}^3$

 $=1100 \text{ cm}^3$

Volume of lead used in the pipe = (1584-1100) cm³ = 484 cm³

Weight of 1 cm³ of lead =11.4 grams
Weight of the lead pipe =484×11.4 grams
=5.5176 kg.

Example 6. Water is flowing at the rate of 3 km an hour through a circular pipe of 20 cm internal diameter into a circular cistern of diameter 10 m and depth 2 m. In how much time will the cistern be filled?

Solution. Radius of the cistern = $\frac{10}{2}$ m=5 m

Depth of the cistern=2 m Volume of a right cylinder= $\pi r^2 h$

· · Volume of the circular cistern= $\frac{22}{7} \times 5^2 \times 2 \text{ m}^3$

$$=\frac{1100}{7}$$
 m³

Internal radius of the circular pipe $=\frac{20}{2}$ cm

$$=10 \text{ cm} = \frac{1}{10} \text{ m}$$

Water is flowing through a circular pipe in the form of a right circular cylinder.

Length of this circular cylinder (in one hour)=3 km

$$=3000 \text{ m}$$

Volume of water poured into the cistern in one hour= $\pi r^2 l$

$$= \frac{22}{7} \times \frac{1}{10} \times \frac{1}{10} \times 3000 \text{ m}^3$$

$$= \frac{660}{7} \text{ m}^3$$

$$= \frac{1100}{7} \div \frac{660}{7} \text{ hours}$$

Time taken to fill the cistern

$$= \frac{1100}{7} \div \frac{330}{7} \text{ hours}$$

$$= \frac{1100}{7} \times \frac{7}{660} \text{ hours} \qquad = \frac{5}{3} \text{ hours}$$

=1 hour 40 minutes.

EXERCISE 5 (c)

(Section A)

- 1. Find the volume of a cylinder of which height=7 metres and radius=10 metres.
- 2. Find the curved surface of the cylinder of which height=14 metres and radius =10 metres.
- 3. The diameter of a cylindrical tank is 24'5 metres and depth 32 metres. How many metric tonnes of water will it hold? (One cubic metre of water weighs 1000 kg).
- 4. Find the volume of a cylinder which has a height of 21 cm and a base of radius 5 cm. Also find the curved surface of the cylinder.
- 5. (a) How many cubic metres of earth must be dug out to make a well 20 metres deep and 2 metres in diameter? $\left(\text{Take } \pi \text{ to be } \frac{22}{7}\right)$
 - (b) If the inner curved surface of the well in part (a) above is to be plastered at the rate of Rs. 5 per sq. metre, find the cost of plastering. (Take π to be $\frac{22}{7}$)
- 6. The area of the curved surface of a cylinder is 4400 cm², and the circumference of its base is 110 cm.

Find (i) the height of the cylinder,

(ii) the volume of the cylinder. $\left(\text{Take }\pi\text{ to be }\frac{22}{7}\right)$

7. A cylinder has a diameter of 20 cm. The area of the curved surface is 1000 cm². Find (i) the height of the cylinder correct to one decimal place, (ii) the volume of the cylinder correct to one decimal place. (Take π to be 3.14)

(Section B)

- 8. Find the volume of a hollow cylinder (open at both ends) whose external diameter is 44 dm, thickness 2 dm, and height 25 dm.
- 9. A cylindrical vessel, whose base is 14 dm in diameter holds 2310 litres of water. Taking a litre of water to occupy 1000 cubic cm, what is the height of the vessel in dm?

- 10. Find in cubic dm the material in a cylindrical tube, the radius of the outer surface being 10 dm, the thickness 4 dm and the height 9 dm.
- 11. The volume of a right circular cylinder is 1100 cubic cm and the radius of its base is 5 cm, find the area of its curved surface.
- 12. Find the whole surface of a hollow cylinder open at the ends, if its length is 8 cm the external diameter is 10 cm and the thickness is 2 cm. (Take $\pi=3.1416$)
- 13. A cylindrical tube open at both ends is made of metal. The internal diameter of the tube is 11.2 cm, and its length is 21 cm. The metal everywhere is 0.4 cm. Calculate the volume of the metal correct to one place of decimal. (Take π to be $\frac{22}{7}$).
- 14. Find how many pieces of money \(\frac{3}{4}\) cm in diameter and \(\frac{1}{8}\) cm thick must be melted down to form a cube whose edge is 3 cm long.
- 15. The radius of the inner surface of a lead pipe is 1.5 dm and the radius of the outer surface is 1.9 dm. If the pipe be melted and formed into a solid cylinder of the same length as before, find its radius.

 (Section C)
- 16. A cubic metre of iron is to be down into a cylindrical wire 50 cm in diameter. What is the length of the wire to the nearest centimetre?
- 17. A well with 10 metres inside diameter is dug 14 metres deep. Earth taken out of it has been spread all-round it to a width of 5 metres to form an embankment. Find the height of the embankment.
- 18. How many litres of water flow through a pipe in one minute if the bore (diameter) of the pipe is 12 cm and water flows at the rate of 3.5 kilometres an hour, and 1 cubic decimetre of water measures 1 litre?
- 19. Water flows along a pipe of radius 0.6 cm at 8 cm per second. This pipe is draining the water from a tank which holds 1000 litres of water when full. How long would it take to completely empty the tank?
- 20. Water flows through a cylindrical pipe of internal diameter 7 cm at 5 metres per second (ms⁻¹).
 - Calculate.(a) the volume, in litres, of water discharged by the pipe in one minute;
 - (b) the time, in minutes, the pipe would take to fill an empty rectangular $\tanh 4 \text{ m} \times 3 \text{ m} \times 23.1 \text{ m}$. (Take π to be $\frac{22}{7}$)

5'5. CONE

You have seen a joker's cap or a ice cream cone. Each of these objects has the shape of a cone.

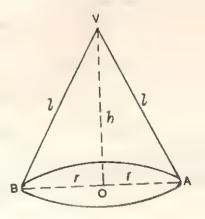

A cone is a solid pointed figure with a circular base. It has one vertex, one edge, one plane surface and one curved surface. In the figure, V is the vertex, O is the centre of the circular base and OA is its radius. We will deal with a right circular cone in which line segment VO is perpendicular to the base.

The length of the segment VO is called the **height** of the cone and is denoted by h.

The distance of the vertex from any point on the circumference of the base is called the slant height of the cone. It is denoted by *I*.

By Pythagoras theorem, we have $r^2+h^2=l^2$

A cone is generally defined as the solid generated by the revolution of a right-angled triangle about one of its sides, containing right angle.

The side of the triangle about which the triangle is revolved is called the axis of the The hypotenuse side is called the generator of the cone. The third side forms the circular base and is the radius of the base.

We state without proof the following formulae:

Volume of a right circular cone $=\frac{1}{2}\pi r^2h$

Curved surface of a right circular cone= πrl

Whole surface of a right circular cone = (curved surface) + (area of the base)

$$=\pi r l + \pi r^2 = \pi r (l+r)$$

We know that the volume of a cylinder of radius r and height h is $\pi r^2 h$. If a cone of height h and radius r is constructed, its volume is $\frac{1}{3}\pi r^2 h$.

What do you observe?

The volume of a cone is one-third of the volume of a cylinder having the same base and the same radius.

A cross-section of a cone by a plane through its axis is an isosceles triangle. But, a cross-section of a cone by a plane parallel to the base is a circle.

Example 7. The diameter of a right circular cone is 14 dm and its slant height is 12 Find the cost of painting its whole surface at the rate of 15 P per square dm. Also find its volume.

Solution. Here radius of the base
$$(r) = \frac{14}{2} dm = 7 dm$$

Curved surface of a right circular cone= πrl

Curved surface of the given cone
$$=\frac{22}{7} \times 7 \times 12$$
 sq. dm

Area of the base of the cone
$$=\pi r^2$$

$$=\frac{22}{7}\times7\times7$$
 sq. dm

$$=154$$
 sq. dm

Whole surface area of the cone
$$=(264+154)$$
 sq. dm

$$=418 \text{ sq. dm}$$

Total cost of painting whole surface of the cone

$$=15\times418 \text{ P}=6270 \text{ P}$$
 =Rs. 62.70

We know that
$$r^2+h^2=l^2$$
 or $h^2=l^2-r^2$ = 144-49

or
$$h^2 = l^2 - r^2 = 144 - 4$$
 $h^2 = 95$

or
$$h^2=95$$
 $h=\sqrt{95}=9.75 \text{ dm}$
Volume of a right circular cone $=\frac{1}{3}\pi r^2 h$

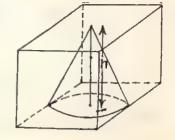

Volume of the given cone
$$= \frac{1}{2} \times \frac{22}{7} \times 7 \times 7 \times 9.75 \text{ cubic details}$$

Volume of the given cone
$$= \frac{1}{3} \times \frac{22}{7} \times 7 \times 7 \times 9.75 \text{ cubic dm}$$
=500.5 cubic dm.

Example 8. Find the volume of the largest right circular cone that can be cut out of a cube whose edge is 9 cm.

Solution. The base of the cone will be the circle inscribed in a face of the cube and its height will be equal to an edge of the cube.

Edge of the cube=9 cm For the cone, Radius of the base $(r)=\frac{9}{2}$ cm Height (h) =9 cm Volume of a right circular cone

$$=\frac{1}{3}\pi r^2h$$

Volume of the cone to be cut out

$$= \frac{1}{3} \times \frac{22}{7} \times \frac{9}{2} \times \frac{9}{2} \times 9 \text{ cubic cm}$$

$$= \frac{2673}{14} \text{ cm}^3 = 190.93 \text{ cm}^3 \text{ nearly.}$$

Example 9. A right circular cylinder and a right circular cone have equal bases and equal heights. If their curved surfaces are in the ratio 8:5, show that the radius of their base is to their height as 3:4.

Solution. Let r and h be the base-radius and height of the cylinder and cone.

Curved surface of the cylinder= $2\pi rh$

Curved surface of the cone $=\pi rl$ where $l=\sqrt{r^2+h^2}$

By the question, $2\pi rh : \pi rl = 8:5$

or $5 \times 2\pi rh = 8 \times \pi rl$

or 5h=4l

or $5h=4\sqrt{r^2+h^2}$

Squaring both sides, $25h^2 = 16 (r^2 + h^2)$

or $9h^2 = 16r^2$

Taking square root, 3h=4r

or $\frac{r}{h} = \frac{3}{4}$

i.e., radius of the base: height=3:4.

EXERCISE 5 (d)

(Section A)

- 1. Find the curved surface of a right cone whose slant height is 25 cm and radius is 7 cm.
- Calculate the curved surface area of a cone whose perpendicular height is 4.8 cm and the radius of whose base is 3.6 cm. Leave your answer in terms of π.
- 3. Find the volume of a right circular cone whose base-radius is 8 cm and vertical height is 14 cm.
- 4. Find the volume of a right circular conical tent whose vertical height is 8 m and the area of whose base is 156 m².

- 5. The height of a circular cone is 36 cm and diameter of its base is 21 cm. Find the whole surface of the cone.
- 6. Find to the nearest cubic centimetre the volume of a cone whose slant height and vertical height are 5 cm and 4 cm respectively.

(Section B)

- 7. Find the slant height of a cone whose volume is equal to 12,936 cubic metres and the diameter of whose base is 42 metres.
- 8. The diameter of a cone is 21 cm. Its volume is 1848 cubic cm. Find the perpendicular height of the cone.
- 9. The volume of a cone is 616 cubic metres. Its perpendicular height is 27 metres. Find the radius of the base.
- 10. The area of the curved surface of a right circular cone of diameter 14 cm is 550 sq. cm. Find its volume.
- 11. How many square metres of canvas are required for a conical circus tent whose height is 35 metres and the radius of the base 84 metres? Also find the volume of air contained in it.
- 12. A conical tent is required to accommodate 7 persons. Each person requires 22 sq. dm of space on the floor and 176 cubic dm of air to breathe. Find the vertical height, the slant height and width of the tent.
- 13. The volume of a cone is the same as that of a cylinder whose height is 9 cm. and diameter 40 cm. Find the radius of the base of the cone, if its height is 108 cm.

(Take π to be $\frac{22}{7}$)

- 14. A cylindrical vessel of internal diameter 2 cm has twice the capacity of a conical vessel of internal radius 1.5 cm and internal depth 4 cm. Find the height of the
- 15. The radius and the height of a right circular cone are in the ratio 5:12. If its volume is 314 cubic metres, find the slant height and the radius. (Use $\pi = 3.14$)

(Section C)

- 16. A conical vessel whose internal radius is 10 centimetres and height 48 centimetres is full of water. If this water is poured into a cylindrical vessel with internal radius 20 centimetres, find the height to which the water rises in it.
- 17. From a solid right circular cylinder with height 10 cm and radius of the base 6 cm, a right circular cone of the same height and base is removed. Find the volume of the
- 18. A girl fills a cylindrical bucket 32 cm in height and 18 cm in radius with sand. She empties the bucket on the ground and makes a conical heap of the sand. If the height of the conical heap is 24 cm, find (i) the radius, and (ii) the slant height of the heap.
- 19. From a solid cylinder whose height is 8 cm and radius 6 cm, a conical cavity of height 8 cm and of base radius 6 cm is hollowed out. Find the volume of the remaining solid $\left(\text{Take }\pi\text{ to be }\frac{22}{7}\right)$

5'6. SPHERE

Glass marbles used for play, small metal balls used in cycle bearings, iron shot used for shot-put are some examples of a sphere. A tennis ball is a hollow sphere.

A sphere is a set of points in space whose distance from a fixed point is equal to a given distance.

The fixed point is called the centre and the given distance is called the radius of the sphere.

A line segment passing through the centre of the sphere having its end points on the sphere is called a **diameter** of the sphere.

All diametres of a sphere are of constant length, each being equal to twice the radius of the sphere.

A plane containing the diameter of a sphere divides the sphere into two equal parts. Each part is called a hemi-sphere. A lemon cut into two halves gives two hemi-spheres.

A sphere is also defined as the solid generated by the rotation of a semi-circle about its diameter. The centre and radius of the semi-circle are respectively the centre and radius of the sphere.

The following formulae are stated without proof:

Volume of a sphere of radius
$$r = \frac{4}{3} \pi r^3$$

Surface area of a sphere of radius
$$r=4\pi r^2$$

Volume of a hemisphere of radius
$$r = \frac{2}{3} \pi r^3$$
.

Example 10. Find the surface and volume of a sphere whose radius is 21 dm.

Solution. Radius of the sphere=21 dm

Surface area of a sphere=
$$4\pi r^2$$

Surface area of the sphere =
$$4 \times \frac{22}{7} \times 21 \times 21$$
 sq. dm

Volume of a sphere
$$=\frac{4}{3}\pi r^3$$

$$\therefore \qquad \text{Volume of the sphere} \qquad = \frac{4}{3} \times \frac{22}{7} \times 21 \times 21 \times 21 \text{ sq. dm}^3$$

=38,808 cubic dm

Example 11. A hemisphere of lead of radius 6 cm is cast into a right circular cone of height 75 cm. Find the radius of the base of the cone.

Solution. Radius of the hemisphere (r)=6 cm

Volume of the hemisphere
$$=\frac{2}{3}\pi r^3$$

 $=\frac{2}{3}\times\frac{22}{7}\times6^3$ cubic cm

Let the radius of the base of the cone be x cm.

Height of the cone = 75 cm
Volume of the cone =
$$\frac{1}{3}\pi r^2 h$$

= $\frac{1}{3} \times \frac{22}{7} \times x^2 \times 75$ cubic cm

Now the volume of the cone=the volume of the hemisphere

$$\frac{1}{3} \times \frac{22}{7} \times x^2 \times 75 = \frac{2}{3} \times \frac{22}{7} \times 6^3$$
or
$$x^2 \times 75 = 2 \times 6 \times 6 \times 6$$
or
$$x^2 = \frac{2 \times 6 \times 6 \times 6}{75}$$

$$= \frac{144}{25}$$

$$\therefore \qquad x = \frac{12}{5}$$

$$= 2 \cdot 4 \text{ cm.}$$

Example 12. The diameter of a sphere is 6 cm. It is melted and drawn into a wire of diameter 0.2 cm. Find the length of the wire.

[C.B.S.E., 1983 (Delhi)]

Solution.

٠.

٠.

Diameter of the sphere=6 cm

Radius of the sphere=3 cm

Volume of a sphere $=\frac{4}{3}\pi r^3$

Volume of the given sphere = $\frac{4}{3} \times \pi \times 3 \times 3 \times 3 \text{ cm}^3$

=36m cm²

Volume of wire to be drawn=Volume of given sphere

 $=36\pi \text{ cm}^3$

Radius of wire=0'1 cm

Let the length of drawn wire be / cm.

Volume of a cylinder=π_{r²l}

Volume of drawn wire= $\pi \times 0.1 \times 0.1 \times l \text{ cm}^3$

 $=0.01\pi l \text{ cm}^2$

But the volume of drawn wire=36m cm3

 $0.01\pi l = 36\pi$

or $\frac{1}{100}l = 36$

=36 metres.

EXERCISE 5 (e)

(Section A)

- 1. Find the surface and volume of a sphere whose radius is 10.5 dm.
- 2. The diameter of a spherical shot-put, made of brass, is 14 cm. Find its surface area and the volume.
- 3. The total surface area of a sphere is 3850 sq. cm. Find the diameter of the sphere,
- 4. The volume of a sphere is 38,808 cubic cm. What is the radius of the sphere?

5. How many litres of water will a hemispherical bowl contain whose radius is 0.7 metre? (1 litre=1000 cubic cm).

(Section B)

6. A solid metal sphere is cut through its centre into two equal parts. If the diameter of the sphere is 3.5 cm, find the total surface of each part, correct to two decimal places.

 $\left(\text{Take }\pi = \frac{22}{7}\right)$

- 7. The volume of one sphere is 64 times that of another sphere. Calculate the ratio of their (i) radii, (ii) surface area.
- 8. How many bullets can be made out of a cube of lead whose edge measures 22 cm, each bullet being 2 cm in diameter?
- 9. How many (spherical) lead shots each 0.3 cm in diameter can be made from a rectangular solid 9 cm by 11 cm by 12 cm?
- 10. The radius of the base of a cone is 4 cm; find the height so that the volume may be equal to that of a sphere with diameter 4 cm.
- 11. A metallic disc, in the shape of a right circular cylinder, is of height 2.5 mm, and base radius 2√3 cm. 12 metallic discs are melted and made into a sphere. Calculate the radius of the sphere.
- 12. The radius of the base of a cone and the radius of a sphere are the same, each being 8 cm. Given that the volumes of these two solids are also the same. Calculate the slant height of the cone, correct to one place of decimal.
- 13. A spherical cannon ball, 6 cm in diameter, is melted and cast into a conical mould, the base of which is 12 cm in diameter. Find the height of the cone.
- 14. A sphere of diameter 6 cm is dropped into a cylindrical vessel partly filled with water. The diameter of the vessel is 12 cm. If the sphere is completely submerged, by how much will the surface of the water be raised?

(Section C)

- 15. Find the volume of a solid in the form of a right circular cylinder with hemispherical ends whose extreme length is 24 dm and diameter 2.5 dm.
- 16. Marbles of diameter 1'4 cm, are dropped into a beaker containing some water and are fully submerged. The diameter of the beaker is 7 cm. Find how many marbles have been dropped in it, if the water rises by 5'6 cm.
- 17. What is the least number of solid metallic spheres of 6 cm in diameter that should be melted and recast to form a solid metal cylinder whose height is 45 cm and diameter 4 cm?
- 18. A spherical ball of lead, 6 cm in diameter is melted and recast into three spherical balls. The diameters of two of these three balls are 3 cm and 4 cm respectively. Find the diameter of the third one.
- 19. A solid sphere of radius 6 cm is melted into a hollow cylinder of uniform thickness. If the external radius of the base of the cylinder is 4 cm and if its height is 72 cm, find the uniform thickness of the cylinder.
- 20. A vessel is in the form of an inverted cone. Its height is 8 cm, and the radius of its top which is open is 5 cm. It is filled with water up to the rim. When lead shots, each of which is a sphere of radius 0.5 cm, are dropped into the vessel, one-fourth of the water flows out. Find the number of lead shots dropped into vessel.

Take π to be $\frac{22}{7}$

REVIEW EXERCISES—IV

(Section A)

- 1. State for each of the following statements whether it is True or False:
 - (a) The area of a triangle with sides measuring a, b, c is given by $\sqrt{s(s-a)(s-b)(s-c)}$, where s is the perimeter of the triangle.
 - (b) The area of a triangle with base 4 cm and perpendicular height 6 cm is 24 cm².
 - (c) The volume of a rectangular solid measuring 1 m by 50 cm by 0.5 m is 2,50,000 cm³.
 - (d) The volume of a sphere of radius r is given by the formula $4\pi r^3$.
 - (e) The volume of a cone is one-half of the volume of the cylinder of the same radius and height.
- 2. Fill in the blanks to make the following statements true:

 - (b) The surface (area) A of a sphere is......

[C.B.S.E., 1978 (Delhi)]

- (c) The volume of a sphere is given by.......
- [C.B.S.E., 1977 (Delhi)]
- (d) If the radius of the base of a cylinder is doubled, its volume becomes......
- (e) In a cuboid, any three co-terminal edges are mutually.......
- (f) The total surface of a right circular cone is given by the formula S=.......
- (g) The volume of a cylinder of radius R and height H is given by.......

[C.B.S.E., 1987 (A.I.)]

(h) If a cylinder and a cone are of the same height and have bases of equal radii, then the volume of the cylinder is.....times that of the cone.

[C.B.S.E., 1987 (Delhi)]

- (i) The volume of a cone of height h and radius of the base r is.......
- 3. The perimeter of a rectangle is 640 cm and the length is to the breadth as 5:3. Find its area.
- 4. What is the area of a square whose diagonal is 15 metres?
- 5. The surface of a cube is 384 sq. cm. Find its volume.
- 6. How many times will the wheel of a car rotate in a journey of 38 km, if it is known that the diameter of the wheel is 56 cm?

 (Take π to be $\frac{22}{7}$)
- 7. A sphere of radius r has the same volume as that of a cone with a circular base of radius r. Find the height of the cone.

 [C.B.S.E., 1984 (Delhi)]
- 8. The radii of two cylinders are in the ratio 2:3 and their heights are in the ratio 5:3. Calculate the ratio of their volumes. [C.B.S.E., 1981 (A.I.)]
- 9. A piece of metal in the form of a cone of radius 3 cm and height 7 cm is melted and cast into a cube. Find a side of the cube.

 (Assume $\pi = \frac{22}{7}$)

[C.B.S.E., 1981 (Delhi)]

(Section B)

- 10. A floor which measures 15 m×8 m is to be laid with tiles measuring 50 cm×25 cm. Find the number of tiles required. Further, if a carpet is laid on the floor so that a space of 1 m exists between its edges and the edges of the floor, what fraction of the floor is uncovered?
- 11. One side of a right-angled triangle is 126 metres, the difference between the hypotenuse and the other side is 42 metres. Find the remaining sides.

- 12. The side of a rhombus is ?6 cm and one of its diagonals is 18 cm, find the other diagonal and the area of the rhombus.
- 13. Find the area of a trapezium whose parallel sides are 11 metres and 25 metres long and the non-parallel sides are 15 metres and 13 metres long respectively.
- 14. The area of a circle is 154 sq. cm. Find the length of the side of the inscribed square.
- 15. A square and a rectangle, each have a perimeter of 48 metres. If the difference between the areas of the two figures is 4 sq. metres, what are the dimensions of the rectangle?

 [C.B.S.E., 1983 (Delhi)]
- 16. Three metal cubes with edges 6 cm, 8 cm and 10 cm respectively are melted together and formed into a single cube. Find the diagonal of this cube. [C B.S.E., 1981 (A.I.)]
- 17. Find what length of canvas 2 metres in width is required to make a conical tent 12 metres in diameter and 6'3 metres in slant height. Also find the cost of the convas at the rate of Rs. 12'50 per metre.

 (Assume $\pi = \frac{22}{7}$)

[C.B.S.E., 1983 (A.I.)] diameter be 50 cm and the length of the tube be 140 cm, find the number of cubic cm

- 19. A right-angled triangle, of which the sides are 3 dm and 4 dm in length is made to turn round on the longer side; find the volume of the cone thus formed.
- 20. A cone is 8.4 cm high and the radius of its base is 2.1 cm. It is melted and recast into a sphere. Determine the radius of the sphere.
- 21. A right circular cone is 4.1 cm high and the radius of its base is 2.1 cm. Another right circular cone is 4.3 cm high and the radius of the base is 2.1 cm. Both the cones are melted together and recast into a sphere. Determine the diameter of the sphere.
- 22. How many metres of wire 0.4 mm in diameter may be drawn from the amount of copper required to mould a solid sphere of diameter 18 cm?

(Section C)

23. If h, c, V are respectively the height, the curved surface and the volume of a cone, prove that

 $3\pi Vh^3 - c^2h^2 + 9V^2 = 0$

- 24. A solid cuboid with areas of adjacent faces 72 sq. cm, 36 sq. cm and 18 sq. cm respectively is melted and cast into a cube. Find the surface area of the cube.

 [C.B.S.E., 1986 (Delhi)]
- 25. A rectangular reservoir with a base 46 metres by 33 metres contains water 2 metres deep. In how much time will the reservoir be emptied by a pipe whose cross-section is a circle with radius 10 dm, if water is flowing at the rate of 7 kilometres per hour?
- 26. A solid metal sphere 6 cm in diameter, is formed into a cylindrical tube 10 cm in external diameter and 4 cm in length; find the thickness of the tube.
- 27. A spherical shell of lead whose external diameter is 18 cm is melted into a right circular cylinder, 8 cm high and 12 cm in diameter. Find the inner diameter of the shell.
- 28. The circular ends of a bucket are of radii 35 cm and 14 cm and the height of the bucket is 40 cm. Find the volume of the bucket.

 [C.B.S.E., 1986 (Delhi)]

SIMILAR TRIANGLES

6.1. SIMILARITY

You have already learnt about congruent figures i.e., figures which have same shape and same size. Some figures, however, have same shape but not necessarily the same size. Such figures are called similar figures. A map of a flat region, for example, is similar to the territory which it represents. A photograph can be enlarged and the enlargement is similar to the original.

Study the following figures:

You can see that any two equilateral triangles are similar, any two squares are similar. Mathematically, however, we must be more precise in defining the similarity of the closed plane figures.

Two rectilinear figures are said to be equiangular to one another, if the angles of the first, taken in order, are respectively equal to the angles of the second, taken in order.

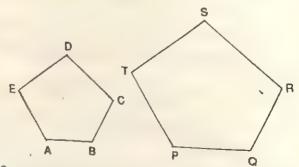

Two rectilinear figures are said to be similar, if they are equiangular to one another, and also their corresponding sides are proportional.

In these polygons $\angle A$ and $\angle P$, $\angle B$ and $\angle Q$, $\angle C$ and $\angle R$, $\angle D$ and $\angle S$, $\angle E$ and $\angle T$ are pairs of equal angles. Sides AB and PQ, BC and QR, CD and RS, DE and ST, EA and TP are corresponding sides.

Polygons ABCDE and PQRST are similar, if

(i)
$$\angle A = \angle P$$
, $\angle B = \angle Q$, $\angle C = \angle R$, $\angle D = \angle S$ and $\angle E = \angle T$

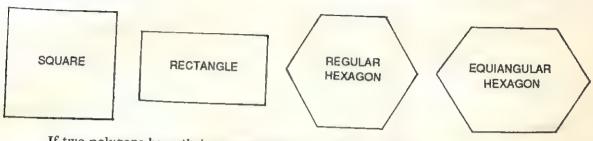

and (ii)
$$\frac{AB}{PQ} = \frac{BC}{QR} = \frac{CD}{RS} = \frac{DE}{ST} = \frac{EA}{TP}$$

It should be noted carefully that two figures are similar only if they satisfy the following two conditions:

- (i) their angles are equal, each to each, and
- (ii) their corresponding sides are proportional.

If two polygons have only their angles equal, each to each, they need not to be similar. See figures given below:

If two polygons have their corresponding sides proportional, they need not be similar. For example, a rhombus and a square have their corresponding sides proportional, but they are not similar because their corresponding angles are not equal.

In case of triangles, the two conditions for similarity are not independent. Two triangles are similar if one condition is satisfied.

6.2. SIMILAR TRIANGLES

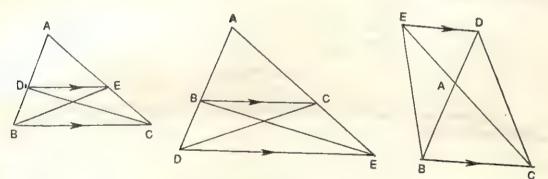

Before we discuss various characteristic properties of similar triangles, we prove the following basic results on proportionality.

THEOREM 45

(Basic Proportionality Theorem)

A line drawn parallel to one side of a triangle divides the other two sides in the same ratio.

[C.B.S.E., 1982 (Delhi); 1983 (A.I.); 1986 (A.I.)]

Given : △ABC.

A line DE is drawn parallel to BC meeting AB and AC (or these sides produced) at D and E respectively.

 $\begin{array}{ccc} \mathbf{To} \ \mathbf{Prove} & \vdots & \frac{\mathbf{AD}}{\mathbf{DB}} = \frac{\mathbf{AE}}{\mathbf{EC}}. \end{array}$

Const. : Join BE and CD.

Proof : △ADE and △DBE have a common vertex E and collinear bases.

$$\frac{\operatorname{ar} (\triangle ADE)}{\operatorname{ar} (\triangle DBE)} = \frac{AD}{DB}$$

$$ADE and AEOD: \dots(1)$$

△ADE and △ECD have a common vertex D and collinear bases.

$$\frac{\text{ar } (\triangle ADE)}{\text{ar } (\triangle ECD)} = \frac{AE}{EC}$$
...(2)

△DBE and △ECD stand on the same base DE and lie between the same parallels.

$$\begin{array}{ll} \therefore & \text{ar } (\triangle DBE) = \text{ar } (\triangle ECD) \\ \text{Now } & \text{ar } (\triangle ADE) = \text{ar } (\triangle ADE) \\ \text{Then } & \frac{\text{ar } (\triangle ADE)}{\text{ar } (\triangle DBE)} = \frac{\text{ar } (\triangle ADE)}{\text{ar } (\triangle ECD)} \\ \therefore & \text{From (1) and (2), we get} \end{array} \qquad \begin{bmatrix} \text{ar } (\triangle DBE) = \text{ar } (\triangle ECD) \\ \text{Proved above.} \end{bmatrix}$$

$$\frac{AD}{DB} = \frac{AE}{EC}$$

$$AD = AE$$

Proved.

Proved above.

Corollary :

or
$$\frac{AD}{DB} = \frac{AE}{EC}$$

$$\frac{DB}{DB} = \frac{EC}{AE}$$

$$\frac{DB}{AD} = \frac{EC}{AE}$$

$$\frac{AD}{AD} = 1 + \frac{EC}{AE}$$
or
$$\frac{AD+DB}{AD} = \frac{AE+EC}{AE}$$
or
$$\frac{AB}{AD} = \frac{AC}{AE}$$

$$\frac{AD}{AB} = \frac{AE}{AC}$$

$$\frac{AD}{DB} = \frac{AE}{EC}$$

$$\frac{AD}{DB} + 1 = \frac{AE}{EC} + 1$$
or
$$\frac{AD+DB}{DB} = \frac{AE+EC}{EC}$$
or
$$\frac{AB}{DB} = \frac{AC}{EC}$$

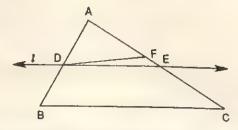

$$\frac{AB}{DB} = \frac{AC}{EC}$$

$$\frac{DB}{AB} = \frac{EC}{AC}$$

THEOREM 46

(Converse of Basic Proportionality Theorem)

If a line divides any two sides of a triangle in the same ratio, the line must be parallel to the third side.

Given

Proof

: ABC in which line l intersects AB in D and AC in E such that

$$\frac{AD}{DB} = \frac{AE}{EC}$$

To Prove

: 1 || BC

: Suppose line *l* is not parallel to BC.

Let us draw through D a line DF paral lel to BC.

Now in △ABC, DF || BC.

By Basic Proportionality Theorem, we get

$$\frac{AD}{DB} = \frac{AF}{FC}$$

But
$$\frac{AD}{DB} = \frac{AE}{EC}$$
 [Given.
 $\therefore \frac{AF}{FC} = \frac{AE}{EC}$
Then $\frac{AF}{FC} + 1 = \frac{AE}{EC} + 1$
or $\frac{AF+FC}{FC} = \frac{AE+EC}{EC}$
or $\frac{AC}{FC} = \frac{AC}{EC}$
 $\therefore FC = EC$

But this is impossible unless the points E and F coincide i.e., DF is the line I itself.

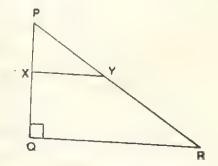

Hence

 $I \parallel BC$.

Proved.

(Section A)

- 1. In a ABC, DE is drawn parallel to BC cutting the other sides at D and E.
 - (a) If AD=12 cm, DB=8 cm and AE=9 cm, find EC.
 - (b) If AB=10 cm, AC=7.5 cm, and AD=6 cm, calculate the length of AE and EC.
- 2. In a ABC, DE is drawn parallel to BC cutting the other sides produced at M and N.
 - (a) If AB=27 mm, AC=21 mm and AM=36 mm, find the length of AN.
 - (b) If AM=6.6 cm, MB=2.4 cm and AC=4.9 cm, calculate the length of NC.
- 3. Prove that the line drawn through the mid-point of one side of a triangle parallel to another side bisects the third side.
- 4. In the given figure PQR is a right-angled triangle, right-angled at Q, XY is parallel to QR, PQ=6 cm, PY=4 cm and PX: XQ=1:2. Calculate the lengths of PR and QR.

(Section B)

- 5. Prove that the line joining the middle points of two sides of a triangle is parallel to the third side.
- 6. If there are three or more parallel lines, and the intercepts on any line that cuts them are equal, then prove that the corresponding intercepts on any other line that cuts them are also equal.
- 7. PQ is drawn parallel to BC cutting the other two sides of a △ABC at P and Q respectively such that AB=24 mm, BC=35 mm and CA=28 mm.
 - (a) If P divides AB internally in the ratio 5:3, calculate the length of the segments AP, PB, AQ and QC.
 - (b) If P divides AB externally in the ratio 5: 3 find the length of the segments AP, PB, AQ and QC,

- 8. Prove that any line drawn from the vertex of a triangle to the base is bisected by the line which joins the middle points of the other two sides of the triangle.
- 9. X, Y, Z are the mid-points of the sides QR, RP, PQ of △PQR. Show that PZXY is a parallelogram.
- 10. If the middle points of the adjacent sides of any quadrilateral are joined, show that the figure thus formed is a parallelogram.

(Section C)

- 11. Prove that a line drawn parallel to the parallel sides of a trapezium cuts the non-parallel sides proportionally.
- 12. Prove that the diagonals of a trapezium cut each other proportionally.
- 13. Prove that the bisector of an angle of a triangle divides the opposite side in the ratio of the sides containing the angle.

Solution:

Given : ABC in which AD, the bisector of

∠A meets BC at D.

To prove : $\frac{BD}{DC} = \frac{AB}{AC}$

Const. : From C, draw ray CF || DA meeting BA

produced in E.

Proof: DA || CE and AC cuts them,

∠DAC=alternate ∠ACE ...(1)

Again, DA || CE and BE cuts them,

 $\angle BAD = corresponding \angle AEC \dots (2)$

But $\angle BAD = \angle DAC$ [Given ...(3)

From (1), (2) and (3), we have

∠ACE=∠AEC

∴ In △CAE, AE=AC

Now in △CBE, DA || CE

$$\frac{BD}{DC} = \frac{BA}{AE}$$

or
$$\frac{BD}{DC} = \frac{AB}{AC}$$

[AE=AC proved,

[Opposite sides.

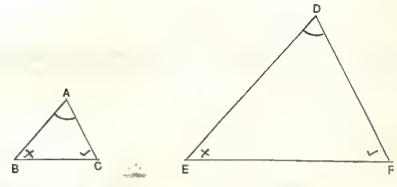

AXIOM

(Similarity—AAA)

If in two triangles, the corresponding angles are equal i.e. if the two triangles are equiangular, then the two triangles are similar.

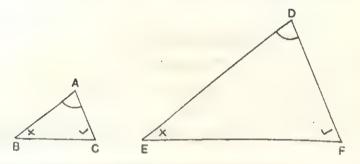

Here we have △ABC and △DEF in which

$$\angle A = \angle D$$
, $\angle B = \angle E$ and $\angle C = \angle F$

Hence △ABC ~ △DEF

Corollary: If two angles of one triangle are equal to two angles of another, each to each, the two triangles are similar.

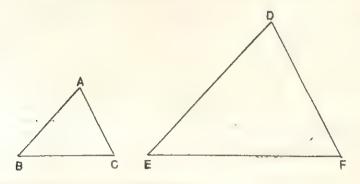

Here we have \triangle ABC and \triangle DEF in which \angle B= \angle E and \angle C= \angle F.

Then
$$\angle A + \angle B + \angle C = \angle D + \angle E + \angle F = 180^{\circ}$$

So, by AAA similarity, the two triangles- \triangle ABC and \triangle DEF are similar.

AXIOM (Similarity—SSS)

If the three sides of one triangle are proportional to the three sides of another, the triangles are similar.

Here we have △ABC and △DEF such that

$$\frac{AB}{DE} = \frac{BC}{EF} = \frac{AC}{DF}$$

Hence △ABC and △DEF are similar,

AXIOM

(Similarity-SAS)

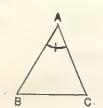

If one angle of a triangle is equal to one angle of another triangle and the sides including these angles are proportional, the two triangles are similar.

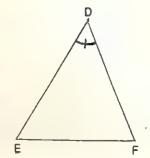

Here we have $\triangle ABC$ and $\triangle DEF$ in which $\angle A = \angle D$

and

$$\frac{AB}{DE} = \frac{AC}{DF}$$

Hence ABC and ADEF are similar.

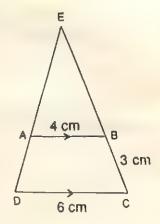

EXERCISE 6 (b)

(Section A)

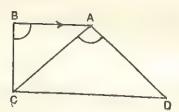

- 1. Prove that two right-angled triangles are similar, if one acute angle of the one is equal to an acute angle of the other.
- 2. Prove that two isosceles triangles are similar, if their vertical angles are equal.
- 3. In the figure alongside ABCD is a trapezium with AB parallel to DC. Given that AB=4 cm, BC=3 cm and CD=6 cm.
 - (a) Name two triangles in the figure which are similar.
 - (b) Calculate the length of EB.
- 4. D is a point on the side BC of a △ABC such that ∠ADC=∠BAC.

Prove that
$$\frac{BC}{CA} = \frac{CA}{CD}$$
.

 In the given figure BA is parallel to CD, \(\subseteq DAC = \subseteq ABC, AB = 10 \) cm, BC = 9 cm, and AC = 15 cm.

Calculate the length of AD,

6. In the adjoining figure, AB, CD and EF are parallel lines. Given that AB=6 cm, CD=y cm, EF=10 cm, AC=4 cm and CF=x cm, calculate the value of x and y.

(Section B)

7. The base AB of an isosceles \triangle ABC is produced both ways to D and E such that AD. BE=AC²; show that \triangle ACD and \triangle BCE are similar.

8. In two equiangular triangles, show that the medians are proportional to the corresponding sides.

9. Prove that a line drawn parallel to one side of a triangle cuts off a triangle similar to the given triangle.

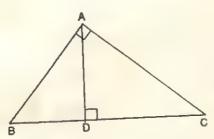

(Section C)

10. Prove that any line drawn parallel to the base of a triangle and meeting the two sides, is bisected by the median to the base.

11. If the diagonals of a quadrilateral intersect each other proportionately, prove that it is a trapezium.

THEOREM 47

A perpendicular drawn from the vertex of the right angle of a right-angled triangle divides the triangle into two triangles similar to each other and also to the original triangle.

Given

: \triangle ABC in which \angle A=90°

AD is drawn perpendicular to the hypotenuse BC.

To Prove

 $: (i) \triangle DBA - \triangle ABC$

(ii) $\triangle DAC \sim \triangle ABC$ (iii) $\triangle DBA \sim \triangle DAC$

Proof

: (i) In \(\triangle DBA \) and \(\triangle ABC \)

∠ADB=∠CAB [Each is a right-angle. ∠DBA=∠ABC [Common angle.

So, by AA-Similarity corollary, we have

△DBA ~ △ABC

(ii) In △DAC and △ABC /ADC=∠BAC

[Each being a right angle.

[Common angle.

∠DCA=∠ACB So, by AA—Similarity corollary, we have

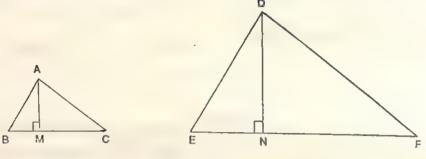

△DAC - △ABC

(iii) △DBA ~ △ABC △DAC ~ △ABC (Proved above)
(Proved above)
Proved.

Hence △DBA ~ △DAC

THEOREM 48

The ratio of areas of similar triangles is equal to the ratio of the squares on the corresponding sides. [C.B.S E., 1980 (A.I.); 1986 (Delhi)]

Given : Two similar triangles ABC and DEF.

 $\frac{\operatorname{ar} \left(\triangle \operatorname{ABC}\right)}{\operatorname{ar} \left(\triangle \operatorname{DEF}\right)} = \frac{\operatorname{AB^2}}{\operatorname{DE^2}} = \frac{\operatorname{BC^2}}{\operatorname{EF^2}} = \frac{\operatorname{AC^2}}{\operatorname{DF^2}}.$ To Prove

Const. : Draw AM 1 BC and DN 1 EF.

Proof : △ABC and △DEF are similar. [Given. $\therefore \angle A = \angle D, \angle B = \angle E \text{ and } \angle C = \angle F$

and $\frac{AB}{DE} = \frac{BC}{EF} = \frac{AC}{DF}$...(1)

In △ABM and △DEN

 $\angle B = \angle E$ [Proved above.

∠AMB=/DNE [Each being a right angle.

So, by AA-Similarity corollary, we get

 $\triangle ABM \sim \triangle DEN$

AB AM DE DN

AM BC AB BC proved above. DN EF

ar (△ABC) ½BC.AM [Area of a triangle= } base × alt. ar (△DEF) JEF.DN

=EF DN

 $\frac{\operatorname{ar}\left(\triangle \operatorname{ABC}\right)}{\operatorname{ar}\left(\triangle \operatorname{DEF}\right)} = \frac{\operatorname{BC}}{\operatorname{EF}} \cdot \frac{\operatorname{BC}}{\operatorname{EF}}$ $\frac{AM}{DN} = \frac{BC}{EF}$ proved above.

 $\frac{BC}{EF} = \frac{AC}{DF} = \frac{AB}{DE}$ But [Proved above.

 $\frac{\text{ar } (\triangle ABC)}{\text{ar } (\triangle DEF)} = \frac{AB^2}{DE^2} = \frac{BC^2}{EF^2} = \frac{AC^2}{DF^2}$ Proved.

EXERCISE 6 (c) (Section A)

- 1. The areas of two similar triangles are equal. Prove that they are congruent.
- 2. Two isosceles triangles have equal vertical angles and their areas have the ratio 9: 16.

- 3. The areas of two similar triangles ABC and PQR are 64 sq. cm and 121 sq. cm respectively. If QR=15.4 cm, find BC.
- ABC is a triangle, right-angled at A, and AD is drawn perpendicular to BC. Show that ∧BAD: △ACD=BA²: AC².

(Section B)

5. OAB and OCD are two lines through O such that OA=2 cm, AB=4 cm, OC=3 cm and CD=6 cm.

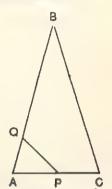

Prove that $\triangle OAC = \frac{1}{8}$ of the quad. ABCD.

- 6. ABC is a triangle and PQ is a line meeting AB in P and AC in Q. If AP=1 cm, PB=3 cm, AQ=1.5 cm and QC=4.5 cm, prove that △APQ=1.6 of the △ABC.
- 7. The given diagram shows two isosceles triangles which are similar. If PQ and BC are not parallel and PC=4, AQ=3,

QB=12 and BC=15.

Calculate (a) the length of AP.

(b) the ratio of the areas of $\triangle APQ$ and $\triangle ABC$, assuming that AP=PQ.

- 8. (a) AD and BE are the medians of △ABC which meet in G. If DE is joined, compare the areas of the triangles ABG and DGE.
 - (b) Also prove that $\triangle DEG = \frac{1}{4} \triangle ABG = \frac{1}{18} \triangle ABC$.
- 9. Show that the areas of similar triangles are proportional to the squares on the corresponding (i) altitudes, (ii) medians.
- ABC is a right-angled triangle and AD is perpendicular to the hypotenuse BC. Prove that
 - (a) $AB^2 = BD.BC$
- (b) $AC^2 = BC.CD$
- (c) $AD^2 = BD.DC$.

(Section C)

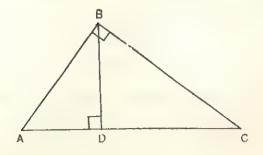

- 11. In $\triangle ABC$, $AD \perp BC$ and is such that $AD^3 = BD.DC$; prove that $\angle A$ is a right angle.
- 12. D, E, F are the middle points of the sides BC, CA and AB respectively of a \triangle ABC. Prove that \triangle DEF= $\frac{1}{2}$ \triangle ABC.

THEOREM 49

(Pythagoras Theorem)

In a right-angled triangle, the square described on the hypotenuse is equal to the sum of the squares described on the sides containing the right-angle.

[C.B.S.E., 1983 (A.I.); 1986 (Delhi)]

Given: A right-angled triangle ABC in which ∠B=90°.

To Prove : $AC^2=AB^2+BC^2$ Const. : Draw $BD \perp AC$.

Proof : In △ADB and △ABC

∠ADB=∠ABC [Each angle is 90°. ∠BAD=∠CAB [Common angle.

So, by AA—Similarity corollary,

△ADB~△ABC

 $\therefore \frac{AD}{AB} = \frac{AB}{AC}$

or $AB^2 = AD.AC$...(1)

In \triangle BDC and \triangle ABC

∠BDC=∠ABC [Each angle is 90°. ∠DCB=∠BCA [Common angle.

So, by AA—Similarity corollary,

△BDC~△ABC

 $\frac{DC}{BC} = \frac{BC}{AC}$

or $BC^3=DC.AC$...(2)

Adding (1) and (2), we get AB²+BC⁸=AD.AC+DC.AC

=(AD+DC).AC=AC.AC

Hence $AB^2+BC^2=AC^2$ i.e., $AC^2=AB^2+BC^2$

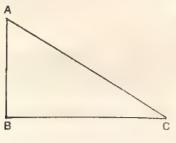

Proved.

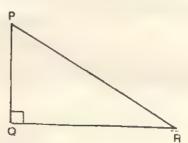

THEOREM 50

(Converse of Pythagoras Theorem)

In a triangle, if the square of one side is equal to the sum of the two sides, then the angle opposite to the first side is a right angle.

[C.B.S.E., 1981 (Delhi); 1985 (A.I.); 1987 (Delhi)]

Given : $\triangle ABC$ such that $AC^2 = AB^2 + BC^2$

To Prove : △ABC=90°

Const. : Construct △PQR such that PQ=AB, QR=BC and ∠PQR=90°
In △PQR, ∠PQR=90°
By Construction

Proof : In △PQR, ∠PQR=90° [By Construction.
∴ PR³=PQ²+QR² [By Pythagoras Theorem.

[PQ=AB, QR=BC, by Construction. $PR^2 = AB^2 + BC^2$ [Given. But AC2=AB2+BC2 PR²=AC² PR=AC OF Now in △ABC and △PQR [By Construction. AB = PQBy Construction. BC = QR[Proved above. AC=PR[SSS-Congruency Theorem. **∧ABC**≃ △PQR [Corresponding parts of congruent triangles. $\angle B = \angle Q$ Then [By Construction. ∠Q=90° But Proved. $\angle B=90^{\circ}$ Hence

EXERCISE 6 (d)

(Section A)

- 1. A ladder I metres long reaches the base of a window of a house h metres above the ground. How far is the foot of the ladder from the house?
- 2. A ladder 13 m long rests against a vertical wall. If the foot of the ladder is 5 m from the foot of the wall, find the distance of the other end of the ladder from ground.
- 3. Prove that the square on the diagonal of a given square is twice the given square.
- 4. In a right-angled triangle ABC, it is given that the hypotenuse AC=2.5 cm, and the side AB=1.5 cm. Calculate the side BC.
- 5. Prove that the three times the square on any side of an equilateral triangle is equal to four times the square on its altitude.
- 6. In △ABC, ∠BCA is a right-angle and Q is mid-point of BC. Prove that $BC^2=4(AQ^2-AC^2)$

(Section B)

- 7. The diagonals of a rhombus are 8 cm and 6 cm. Find the perimeter of the rhombus.
- 8. A ladder 50 dm long is placed so as to reach, a window 48 dm high; and on turning the ladder over to the other side of the street, it reaches a point 14 dm high. Calculate the breadth of the street.
- 9. Prove that the sum of the squares on the diagonals of a rhombus is equal to the sum of the squares on the sides.
- 10. A point O is taken inside a △ABC; OP, OQ, OR are drawn perpendicular to BC, CA and AB respectively. Show that

$$BP^2+CQ^2+AR^2=CP^2+AQ^2+BR^2$$

- 11. In △ABC, ∠C is acute and AD⊥BC. Prove that AB²=BC²+AC³-2 BC.CD
- 12. In △ABC, ∠C is obtuse and AD⊥BC. Prove that $AB^2 = BC^2 + AC^2 + 2BC.CD$

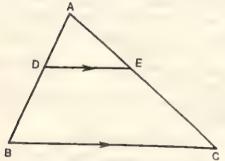

(Section C)

- 13. In $\triangle ABC$, $\angle C=1$ right angle, M is the mid-point of BC and N of CA. Prove that $4 (AM^2 + BN^2) = 5 AB^2$
- 14. If ABCD be a rectangle and O any point within it, show that $OA^2 + OC^2 = OB^2 + OD^2$

REVIEW EXERCISE V

(Section A)

- 1. In answer to each of the following statements write True or False as appropriate:
 - (a) If two triangles are congruent, then they are also similar.
 - (b) The altitude on the hypotenuse of a right-angled triangle is the mean proportional between the segments of the hypotenuse.
 - (c) If the sides of a triangle measures 3 cm, 4 cm, 5 cm, then it is a right triangle.
- 2. Fill in the blanks to make the following statements true:
 - (a) The ratio of any two corresponding sides of two similar triangles is 3:2. The ratio of the areas of the two triangles is-----[C.B.S.E., 1984 (A.I.)]
 - (b) If in two triangles corresponding angles are equal, their corresponding sides [C.B.S.E., 1983 (A.I.)]
 - (c) The ratio of areas of similar triangles is equal to the ratio of the......on the [C.B.S.E., 1982 (Delhi); 1986 (A.I.)]
 - (d) If a line divides two sides of a triangle in the same ratio, then the line is..... [C.B.S.E., 1980 (A.I.); 1986 (A.I.)]
 - (e) If PQ is drawn parallel to side BC of a triangle ABC, where AP: PB=1:3 and AQ=4 cm, then AC=..... [C.B S.E., 1986 (Delhi)]
 - (f) If the corresponding sides of two triangles are proportional, then the triangles [C.B.S.E., 1986 (Delhi)]

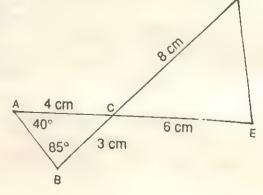

(g) In the figure, DE || BC, $\frac{AD}{DB} = \frac{3}{5}$.

If AC=4.8 cm, then AE=.....

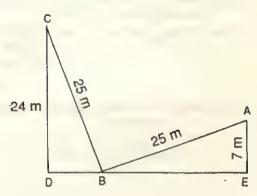

[C.B.S.E., 1984 (Delhi)]

- (h) If two polygons have their corresponding sides proportional, they.....be
- 3. In the given figure ACE and BCD are two lines, $\angle A=40^{\circ}$ and $\angle B=85^{\circ}$. Using the measurements given in the figure, complete the following true statements:
 - (i) Triangles ABC and CDE are similar because.....
 - (ii) The size of \(D \) is......
 - (iii) If AB=x cm, then ED=...

(Section B)

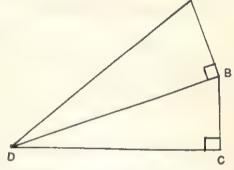

4. In the given figure, AB=BC=25 m. If AE=7 m, and CD=24 m, find the length of DE and also show that ABE and △BDC are congruent.

5. The given figure ABCD represents a quadrilateral in which AD=13 cm, DC=12 cm, BC=3 cm and $\angle ABD = \angle BCD = 90^{\circ}$.

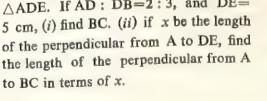

Calculate the length of AB.

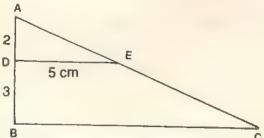

to BC in terms of x.

- 6. ABC is a triangle in which $\angle BAC=90^{\circ}$ and AD $\perp BC$. Prove that AD²=BD×DC. [C.B.S.E., 1982 (Delhi); 1985 (A.I.)]
- 7. In $\triangle ABC$, $AD \perp BC$ and $AD^2 = BD \times DC$. Prove that ABC is a right triangle. [C.B.S.E., 1983 (Delhi)]
- 8. In ABC, right-angled at C, Q is the mid-point of the side BC, show that [C.B.S.E., 1981 (Delhi)] $AB^2 = 4AQ^2 - 3AC^2$.
- 9. P and Q are points on the sides CA and CB respectively of a triangle ABC, right angled at C. $AQ^2 + BP^2 = AB^2 + PQ^2$ Prove that [C.B.S.E., 1982 (A.I.); 1984 (Delhi); 1984 (A.I.)]

10. In the figure given alongside △ABC~ 2 △ADE. If AD: DB=2:3, and DE= 5 cm, (i) find BC. (ii) if x be the length D 5 cm of the perpendicular from A to DE, find

- 11. In ABC, points D, E, F are the mid-points of BC, CA and AB respectively. Prove that AD bisects EF.
- 12. ABC is a triangle, D is a point on AB such that AD={AB and E is a point on AC such that $AE = \frac{1}{4} AC$. Prove that $DE = \frac{1}{4} BC$.

- 13. ABCD is a rhombus with P, Q, R as a mid-points of AB, BC and CD. Prove that PQ is perpendicular to QR.
- 14. If three concurrent lines through P are cut by two parallel transversals in A, B, C and L, M, N respectively, prove that

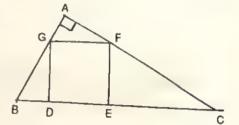

AB: BC=LM: MN

(Section C)

- 15. PQRS is a parallelogram. A line through R meets PQ produced at X and PS produced at Y. Prove that
 - (i) XQ : QR = XP : PY,
 - (ii) QR : SY = QX : RS.
- 16. In the figure, DEFG is a square and ∠BAC=90°.

Prove that $DE^a=BD\times EC$.

[C.B.S.E, 1987 (A.I.)]

7

CIRCLES

7.1. CIRCLE

We come across many objects in our daily life which are round i.e., circular in shape. The word 'circular' means 'like a circle' or 'of the shape of a circle'. We shall now discuss circles and some of their properties.

A circle is a set of those points in a plane which are at a given constant distance from a given fixed point in the plane.

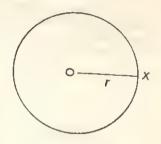

The fixed point is called the centre of the circle and the constant distance is called the radius of the circle.

Circle can also be defined as a locus.

If a point moves in a plane such that its distance from a given point in the plane remains constant, then the locus of the point is called a circle.

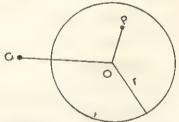

A circle with centre O and radius r is denoted by C (O, r). In set notation we write as

$$C = \{X : OX = r\}$$

A point P is said to lie inside the circle when OP < r.

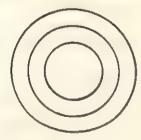

A point Q is said to lie outside the circle when OQ>r.

A circle of radius r divides the plane into three mutually disjoint sets—interior, exterior and the circle itself.

The perimeter of a circle is called its circumference.

Circles having the same centre are said to be concentric circles. Note that these circles have different radii.

Note that we have used the notation AB to denote the line segment AB and as also its length. Similarly the word 'radius' will be used for a line segment joining the centre to any point on the circle and also for its length.

A line segment joining two points on a circle is called a chord,

AB and CD are the two chords of the circle with centre O.

A line segment PQ passing through the centre O of the circle and having its end points P and Q on the circle is called a diameter of the circle.

Observe that a chord passing through the centre of the circle is a diameter of the circle.

Here PQ is a diameter and OP, OQ are two radii.

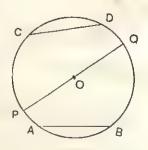

Then $PQ = OP + OQ = 2 \times radius$.

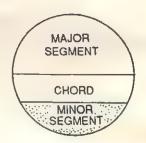

How many diameters can be had for a given circle?

A circle has many diameters. All diameters of a circle are equal.

A chord of a circle divides the region enclosed by the circle into two parts. Each of the parts is called a segment of the circle.

The segment containing the diameter is called the major segment and the segment not containing the diameter is called the minor segment. Each of them is called the alternate segment of the other.

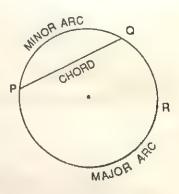

A chord of a circle divides the circle into two parts, each of which is called an arc of the circle.

We denote the arc from P to Q by PQ.

An arc of a circle has a length. Note that l(PQ) denotes the length of \overrightarrow{PQ} .

The larger of the two arcs is called the major arc and the smaller one is called the minor arc. Here PQ is the minor and arc PRQ is the major arc.

The diameter of a circle divides the circle into two equal parts, each of which is called a semi-circle.

72. CONGRUENCE OF CIRCLES AND ARCS

We have learnt about congruence of line segments, angles and triangles in earlier classes. We shall now discuss congruence of circles and arcs.

Generally two circles are said to be congruent if and only if one of them can be superposed on the other so as to cover it exactly.

Let C (O, r) and C (O', s) be two circles.

Let us superpose circle C(O', s) on the circle C(O, r) so that O' coincides with O.

It can be easily seen that C(O', s) will cover C(O, r) completely, if and only if s=r.

Hence we can say that two circles are congruent, if and only if, they have equal radii.

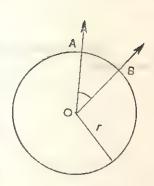

Let C (O, r) be any circle.

Then any angle whose vertex is centre O is called a central angle.

Here ∠AOB is the central angle. It intercepts the minor arc \widehat{AB} of the circle.

The length of an arc is closely associated with the central angle determining the arc. So, the degree measure of an arc is defined in terms the central angle.

The degree measure of a circle is taken to be 360° . Then the degree measure of a semi-circle is 180° . The degree measure of an arc \widehat{AB} is denoted by m (\widehat{AB}).

The degree measure of a minor arc is the measure of the central angle containing the arc.

The degree measure of a major arc is 360° minus the degree measure of the corresponding minor arc.

Two arcs of a circle (or of congruent circles) are congruent, if one of them can be superposed on the other so as to cover it completely. This is possible only when degree measures of the two arcs are equal.

Hence we can say that two arcs of a circle (or of congruent circles) are said to be congruent, if and only if they have the same degree measure.

Thus, if $m(\widehat{PQ})=m(\widehat{RS})$, then $\widehat{PQ}\cong\widehat{RS}$.

If \widehat{AB} is congruent to \widehat{CD} , we write $\widehat{AB} \cong \widehat{CD}$.

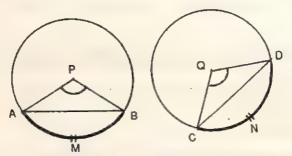

With every arc-minor or major is associated a unique chord obtained by joining the two ends of the arc.

EXERCISE 7 (a)

- 1. What is the distance of a diameter from the centre of circle?
- 2. A cycle-wheel is lying flat on the ground. A long rod is placed over it. In how many places do they make contact?
- 3. Do concentric circles have any common point?
- 4. PQ is a chord of a circle whose centre is O. Is PO=QO?
- 5. Is a major arc of a given circle greater than its semi-circle?
- 6. What is the relation between a diameter and a radius of the circle?
- 7. When is a chord, a diameter of the circle?
- 8. What can be the maximum length of a chord of a circle?
- 9. What is the difference between a circle and its circumference?
- 10. If X is any point on the chord PQ of a circle with centre A, show that AX≤AP.

THEOREM 51

If two arcs of congruent circles are congruent, then their corresponding chords are equal.

Given: Two congruent circles with centres P and Q.

ÂB ≃ ĈD

To Prove: AB = CD

Const. : Join AP, BP, CQ and DQ.

Proof : $\widehat{AB} \cong \widehat{CD}$ (Given)

 $\therefore m \widehat{AB} = m \widehat{CD}$ i.e., $\angle APB = \angle CQD$

In $\triangle APB$ and $\triangle CQD$

PA = QC PB = QD

AB = CD

Incl. \(\text{APB} = \text{Incl.} \(\text{CQD} \)

 $\triangle APB \cong \triangle CQD$

[Radii of congruent circles]

[Radii of Congruent circles]

[Proved above]
[SAS Congruency Axiom]

[Corresponding parts of congruent triangles]

Proved.

This theorem is also true if the congruent arcs are taken in the same circle. Then it can be stated as under:

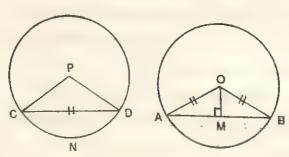

If two arcs of a circle are congruent, their corresponding chords are equal.

Its proof is similar to the above.

THEOREM 52

(Converse of Theorem 51)

If two chords of congruent circles are equal, then their corresponding arcs are congruent,

Given: Two congruent circles with centres O and P in which

AB = CD

To Prove : $\widehat{AB} \cong \widehat{CD}$

Const. : Let \widehat{AB} and \widehat{CD} be minor arcs. Join AO, BO, CP and DP.

Proof : In △AOM and △CPD

OA=PC [Radii of the congruent circles]

AB=CD [Given]

OB=PD [Radii of the congruent circles]

∴ △AOM ≅ △CPD [SSS Congruency Theorem]
∴ ∠AOB=/CPD [Corresponding and Congruency Theorem]

:. \(\text{AOB} = \text{CPD} \) [Corresponding parts of congruent triangles

Then $m\widehat{AB} = m\widehat{CD}$

 \therefore $\overrightarrow{AB} \cong \overrightarrow{CD}$ Proved

This theorem is also true when equal chords are taken in the same circle. Then] it can be stated as under:

If two chords of a circle are equal, their corresponding arcs are congruent.

Its proof is similar. Write the complete proof yourself.

EXERCISE 7 (b)

(Section A)

- 1. AB and AC are equal chords of a circle; show that A is the mid-point of the arc
- 2. If two equal chords AB and CD of a circle intersect in it, prove that
- 3. If a pair of opposite sides of a quadrilateral inscribed in a circle are equal, prove that its diagonals are equal.

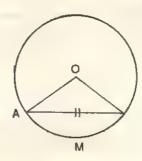

(Section B)

- 4. If two triangles are inscribed in congruent circles (or in the same circle) such that two sides of the one are equal to two sides of the other, each to each, prove that the triangles are congruent.
- 5. If in two circles two equal chords subtend equal angles at the centres, prove that the two circles are congruent.

THEOREM 53

The perpendicular drawn from the centre of a circle to a chord, bisects the chord.

[C.B.S.E., 1977 (Delhi)]

Given

· A circle with centre O.

chord AB, and OM LAB.

To Prove : AM=MB.

Const.

: Join OA and OR.

Proof

: In \(OMA \) and \(OMB \)

/OMA = /OMB

=90°

hyp. OA=hyp. OB

OM = OM

and △OMA≃ △OMB

AM = MBThen

[OM LAB, given]

Radii of the same circle

[Common to both]

[RHS Congruency Theorem]

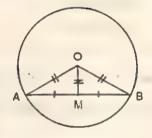

[Corresponding parts of congruent triangles]

Proved.

THEOREM 54

(Converse of Theorem 53)

A line drawn from the centre, of a circle to bisect a chord, which is not a diameter, is at right-angles to the chord.

Given

: A circle with centre O.

Chord AB and its mid-point M.

OM is joined.

To Prove : OM LAB.

: Join OA and OB. Const.

Proof

: In \(\triangle sOMA \) and OMB

AM = MB

[Given]

OA = OB

[Radii of the same circle]

OM = OM

[Common to both]

△OMA≅△OMB

[SSS Congruency Theorem]

Then / OMA=/ OMB

[Corresponding parts of congruent triangles.]

∠OMA+∠OMB=2rt ∠s

[MO stands on AB]

/OMA=/OMB OM LAB i e .,

=1 rt./.

Proved.

Note. When a chord passes through the centre it becomes a diameter. Its mid-point coincides with the centre. Hence any line, not necessarily perpendicular but passing through the centre, bisects it.

EXERCISE 7 (c)

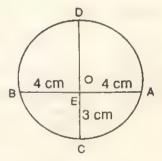

(Section A)

- 1. Prove that the right-bisector of a chord of a circle passes through the centre of the circle.
- 2. In a circle of 5 cm radius, a chord 6 cm in length is placed. Find the distance of the chord from the centre.
- 3. A chord 4 cm in length is placed in a circle at a distance of 1.5 cm from the centre.

 Calculate the radius of the circle.
- 4. In a circle of a radius 5 cm, AB and CD are two parallel chords of length 8 cm and 6 cm respectively. Calculate the distance between the chords, if they are on
 - (i) the same side of the centre.
 - (ii) opposite sides of the centre.
- 5. (a) Two parallel chords 3 cm and 4 cm in length respectively are placed on either side of the centre of a circle of radius 2.5 cm. Find the distance between them.
 - (b) If they are placed on the same side of the centre, what will the distance be?

(Section B)

6. In the figure given alongside, CD is a diameter which meets the chord AB in E, such that AE=BE=4 cm. If CE is 3 cm, find the radius of the circle.

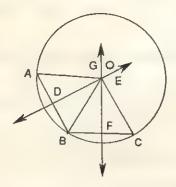

- 7. Prove that the line joining the mid-points of two parallel chords of a circle (a) passes through the centre, (b) is perpendicular to both the chords.
- 8. ABCD is a rectangle whose vertices lie on the circumference of a circle. Prove that AC and BD are the diameters of the circle.
- 9. O is a centre of a circle of radius 5 cm. P is any point in the circle such that OP=3 cm. A is the point travelling along the circumference. x is the distance from A to P. What are the least and greatest values of x in cm? What is the position of the points O, P and A at these values?

(Section C)

10. If two circles intersect each other, then prove that the line joining their centres bisects the common chord at right-angles.

THEOREM 55

There is one circle, and only one, which passes through three given points, not in a line.

Given: Three non-collinear points A, B and C.

To Prove: There is one and only one circle passing through the points A, B and C.

Const. : Draw line segments AB and BC.

Draw DE and FG, the right-bisectors of AB and BC respectively.

Since A, B, C are not collinear, the right-bisectors of AB and BC are not parallel. They will intersect at some point O.

Join OA, OB and OC.

Proof: O lies on DE, the right-bisector of AB.

... OA=OB

O lies on FG, the right-bisector of BC.

... OB=OC ...(2)

From (1) and (2), we get OA=OB=OC=r (say)

With centre O and r as radius one circle can be drawn to pass through A, B and C.

Since two lines DE and FG can intersect only at one point,

O is the only point equidistant from A, B and C.

Hence only one circle can be drawn through A, B and C.

i.e., there is a unique circle passing through three non-collinear points.

Proved.

EXERCISE 7 (d)

(Section A)

1. Given an arc of a circle. Complete it.

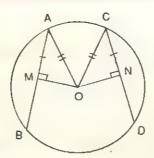

- 2. If from a certain point within a circle three or more equal line segments be drawn to the circumference, show that the point is the centre of the circle.
- 3. Prove that the right-bisectors of the sides of a triangle meet at a point.

(Section B)

- 4. Show that a circle can be drawn to pass through the angular points of a rectangle.
- 5. If the right-bisectors of the sides of a polygon are concurrent, show that a circle can be drawn through its vertices.

THEOREM 56

Equal chords of a circle are equidistant from the centre. [C.B.S.E., 1978 (A.I).]

Given : A circle with centre O in which

chord AB=chord CD. OM \(\text{AB} \) and ON \(\text{CD} \).

To Prove : OM=ON.

Const. : Join OA and OC.

Proof: OM is prep. to the chord AB from centre O.

 $\therefore \qquad AM = \frac{1}{2}AB$

ON is prep. to the chord CD from centre O.

 $CN = \frac{1}{2}CD$

or $\frac{1}{2}AB = \frac{1}{2}CD$ [AB=CD, given]

Then AM=CN [$\frac{1}{2}AB=AM$ and $\frac{1}{2}CD=CN$ proved above]

In the rt. ∠d△s AMO and CNO

hyp. OA=hyp. OC [Radii of the same circle]

AM=CN [Proved above]

∴ △AMO≅△CNO [RHS Congruency Theorem]

Then OM=ON [Corresponding parts of congruent

triangles] Proved

i.e., chord AB and CD are equidistant from the centre O.

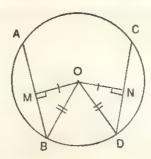

The above theorem is also true for congruent circles. It can be stated as:

In congruent circles, equal chords are equidistant from the centres.

THEOREM 57

(Converse of Theorem 56)

Chords which are equidistant from the centre of a circle are equal.

: Chords AB and CD of the circle with centre O. Given

OM LAB; ON LCD

and OM=ON.

To Prove : AB=CD

: Join OB and OD. Const.

: OM is drawn perp. to the chord AB from centre O. Proof

BM=4AB

ON is drawn perp. to the chord CD from centre O.

DN=1CD In rt. ∠d △s BMO and DNO

> hyp. OB=hyp. OD [Radii of the same circle] OM = ON[Given]

△BMO≅ △DNO ... [RHS Congruency Theorem]

Then BM=DN [Corresponding parts of congruent

triangles.] i.e., $\frac{1}{2}AB = \frac{1}{2}CD$ $[BM = \frac{1}{2} AB \text{ and } DN = \frac{1}{2} CD, \text{ proved}$

abovel AB = CDProved.

This theorem is also true for congruent circles. It can be stated as:

In congruent circles, chords which are equidistant from the centre are equal.

EXERCISE 7 (e)

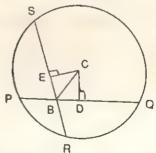

(Section A)

- 1. In a circle with centre O, two equal chords AB and AC are-drawn. Prove that
- 2. AB and CD are two chords of a circle with M and N as their mid-points. Prove that MN makes equal angles with AB and CD.
- 3. Two equal chords of a circle intersect at a point in it. Prove that they are equally inclined to the diameter through the point of intersection.
- 4. AB and CD are equal chords of a circle whose centre is O. When produced, these chords meet at E. Prove that EB=ED and EA=EC.

(Section B)

- 5. Draw a circle with diameter of 5 cm. Place in it two equal chords, each 3 cm long. Calculate their distances from the centre and verify your result by measurement.
- 6. C is the centre of the circle. CB bisects the \(DBE, \) CD L PQ and CE L RS.

Prove that PQ=RS.

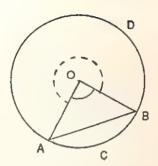

7. If two chords of a circle cut each other and make equal angles with a line which joins their point of intersection to the centre, prove that they are equal.

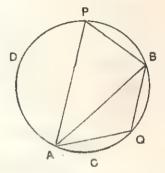

7.3 ANGLES IN CIRCLES

The angle subtended by the line segment AB i.e., chord AB at O is \angle AOB, and the angle subtended by the arc ACB at O is also \angle AOB.

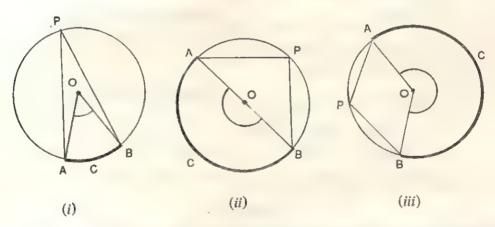

Also, arc ADB subtends the reflex angle AOB at the centre O.

Chord AB subtends \(APB \) at P and \(AQB \) at Q. Also, arc ACB subtends \(APB \) at P and arc ADB subtends \(AQB \) at Q.

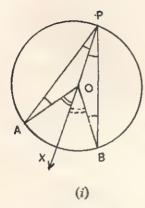

In the figures given below, arc ACB subtends / AOB at the centre O and / APB at the point P on the circumference.

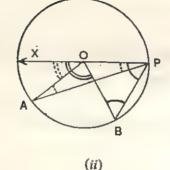

∠AOB is an acute angle in Fig. (i), a straight angle in Fig. (ii) and a reflex angle in (iii).

THEOREM 58

The angle which an arc of a circle subtends at the centre is double that which it subtends at any point on the remaining part of the circumference.

Given

A circle with centre O.

An arc AB subtends \(\triangle AOB \) at the centre O and \(\triangle APB \) at a point P on the remaining part of the circumference.

To Prove : /AOB=2/APB.

: Join PO and produce it to any point X. Const.

Proof

In △AOP. OP=OA (Radii of the same circle.)

∠OAP=/APO (Opposite angles to equal sides.)

ext. \(\text{AOX} = \text{OAP} + \text{APO} (ext. angle of a triangle=sum of int. opp. ∠s) ext. \(AOX=2\) APO

...(i) $(\angle OAP = \angle APO Proved above)$

Similarly in \(\triangle BOP. \)

ext. \(BOX=2\times BPO ...(ii)

In figure (i). [Adding (i) and (ii)]

 $\angle AOX + \angle BOX = 2\angle APO + 2\angle BPO$

or \(\triangle AOB=2 \) (\(\triangle APO+ \triangle BPO \)

or \(AOB=2\) APB

In figure (ii). [Subtracting (i) from (ii)]

∠BOX-∠AOX=2/BPO-2/APO

or \(\text{AOB}=2 \left(\text{BPO} - \text{APO} \right)

or $\angle AOB = 2 \angle APB$. Proved

Corollary. Congruent arcs of the same circle or congruent circles subtend equal angles at the remaining part of the circumference.

EXERCISE 7 (f)

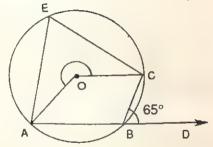

(Section A)

- 1. In a circle with centre O, there are two chords PQ and QR meeting at an angle of 68°.
- 2. Two radii OA and OB of a circle make an angle of 136° at the centre. If a point P lies on the minor arc so that \(\text{OAP} = 54°, \text{ find the angle OBP.} \)
- 3. O is the circumcentre of a ABC. D is the middle point of BC. Show that

- 4. Prove that parallel chords of a circle intercept equal arcs.
- 5. In the figure given alongside, O is the centre of the circle, ABD is a line and ∠CBD=65°.

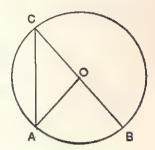

Find (a) ∠AEC

(b) ∠AOC (angle marked)

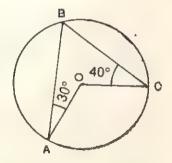

(Section B)

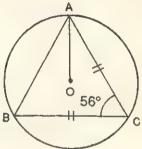

6. O is the centre of the circle. Given ∠ AOB=80°. Calculate the value of ∠OBA and ∠OAC.

7. In the given figure, O is the centre of the circle. ∠OAB and ∠OCB are 30° and 40° respectively. Find ∠AOC. Show your steps of working.

- 8. A, B, C, D are four points on the circumference of a circle in that order and AD=BC; show that AB is parallel to DC.
- 9. In the adjoining figure, O is the circumcentre of triangle ABC in which AC=BC. Given that ∠ACB=56°. Calculate
 - (a) ∠CAB
 - (b) ∠OAC.

10. Two equal circles intersect in A and B and through A a line is drawn to meet the circles in P and Q respectively. Prove that PB=BQ.

(Section C)

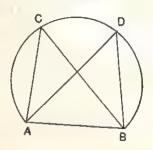

11. If O is the orthocentre of the triangle ABC and if the perpendicular AD is produced to meet the circumference in E, prove that OD=DE.

7.4. ANGLES IN THE SEGMENTS

The angle subtended by the base of a segment at any point on the arc of the segment is called an angle in the segment.

In the figure chord AB of the segment ABDC subtends ∠ACB at the point C on the arc. Then ∠ACB is an angle in the segment ABDC. Similarly / ADB is an angle in the segment ABDC. Thus angles ACB and ADB are in the same segment.

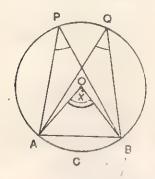

Note: ∠ACB and ∠ADB are subtended by the same chord AB at different points C and D on the same arc ACDB.

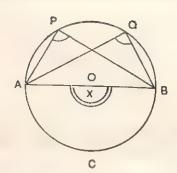

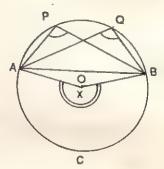

THEOREM 59

Angles in the same segment of a circle are equal.

[C.B.S.E., 1981 (A I.)]

Given

: A segment APQB of a circle with centre O.

Any two ∠s APB and AQB in it.

To Prove : \(APB = \(AQB \)

Const.

: Join AO and BO.

Proof

: Arc ACB subtends \(\times AOB \) at the centre O and \(\times APB \) at a point P on the

 $\angle APB = \frac{1}{6} \angle AOB$ $\angle APB = \frac{1}{2} \angle x$ i.e.,

···(i)

Arc ACB subtends \(\times AOB at the centre O and \(\times AQB on the circumference. \)

 $\angle AQB = \frac{1}{2} \angle AOB$

i.e., $\angle AQB = \frac{1}{2} \angle x$

···(ii)

From (i) and (ii), we have

 $\angle APB = \angle AOB$

Proved.

Corollary. Angles subtended by the same arc of a circle at different points on the circumference are equal.

EXERCISE 7 (g)

(Section A)

 AB and CD are two chords of a circle intersecting at O. Prove that △AOD and ∧BOC are equiangular.

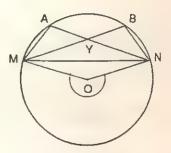

2. In a circle with centre O, two chords AB and CD intersect each other at P. If $\angle ABC = 47^{\circ}$ and $\angle APC = 113^{\circ}$, find the angle BAD.

3. Through P, a point outside a circle with centre O, lines PAB and PCD are drawn to cut the circle in A, B and C, D respectively. Prove that △APD and △ CPB are equiangular.

4. Two chords AB and CD of a circle intersect at P within it. If AP=AC, show that DP=DB.

(Section B)

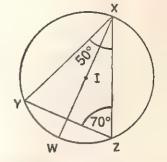

5. In the figure, M, A, B and N are points on a circle having centre O. AN and MB cut at Y. ∠NYB=50° and ∠YNB=20°. Find the angle MAN and the reflex angle MON.

6. In the diagram I is the incentre of triangle XYZ, XI produced meets the circumcircle of triangle XYZ at W, ∠YXZ=50° and ∠XZY=70°.

Calculate (a) \(\text{WYZ} \)

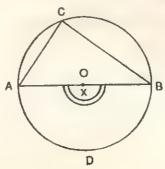

- (b) ∠1YZ
- (c) ZYIW

7. Prove that the bisectors of the angles in the segment of a circle are congruent.

THEOREM 60

The angle in a semi-circle is a right angle.

: A semi-circle AOBC with centre O, and any angle ACB in the semi-circle. Given

: ∠ACB=1 rt. ∠ To Prove : Complete the circle. Const.

: Arc ADB subtends \(\triangle AOB \) at the centre O and \(\triangle ACB \) at a point C on the Proof remaining part of the circumference.

 $\angle ACB = \frac{1}{2} \angle AOB$ or $\angle ACB = \frac{1}{2} / x$ But $\angle x=2 \text{ rt } \angle s$

(AOB is a line, being a diameter.)

. . $\angle ACB = \frac{1}{2} \times 2 \text{ rt } \angle s$ $\angle ACB=1 \text{ rt } \angle.$ OT

Proved

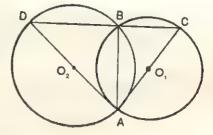

EXERCISE 7 (h)

(Section A)

- 1. Prove that the circles described on any two sides of a triangle as diameters intersect on
- 2. Two circles intersect at P and Q. Through P two diameters PA and PB are drawn once in each circle. Prove that points A, Q, B are in the same line.
- 3. AB is a chord of a circle whose centre is C. Prove that the circle described on AC as

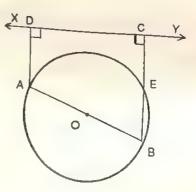

(Section B)

- 4. Prove that angle in a major segment is acute and that in a minor segment is obtuse.
- 5. In the figure, AB is the common chord of the two circles. If AC and AD are diameters, prove that D, B and C are in a line. O1 and O2 are the centres of the circles.

- 6. If the diagonals of a quadrilateral inscribed in a circle pass through the centre of th circle, prove that the quadrilateral is a rectangle.
- 7. In the figure, AB is a diameter of the circle whose centre is O. AD and BC are perpendiculars to the line XY. CB meets the circle at E.

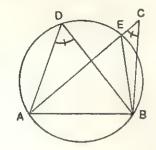

Prove that CE=AD.

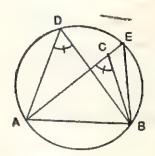

THEOREM 61

If a line segment joining two points subtends equal angles at two other points lying on the same side of the line containing the segment, the four points lie on the same circle.

[C.B.S.E., 1983 (Delhi)]

Given

: Four points A, B, C and D.

Line segment AB subtends \(\triangle ACB \) at C and \(\triangle ADB \) at D on the same side of the line containing AB such that \(ADB = \(ACB. \)

To Prove: Points A, B, C and D are concyclic i.e., lie on the same circle.

Const.

: Draw a circle to pass through three non-collinear points A, B and D.

Proof

: If the circle does not pass through the point C, it will intersect the line containing AC at a point E.

Now \(ADB \) and \(AEB \) are in the same segment ADEB of the circle.

 $\angle ADB = / AEB$ But $\angle ADB = \angle ACB$ (Given) . . ∠AEB=/ACB

This means that an exterior angle of \(\triangle BCE \) is equal to an interior opposite

which is impossible unless E coincides with C.

Thus, our assumption that the circle does not pass through C is false.

... the circle passing through A, B, D must pass through C.

i.e., the four points A, B, C, D are concyclic.

Proved.

EXERCISE 7 (i)

1. Prove that four vertices of a regular pentagon are concyclic.

Hint: Let ABCDE be a regular pentagon.

Join AC and BE.

 $\triangle ABE \cong \triangle ABC$

Then $\angle AEB = \angle ACB$.

2. Prove that the middle points of the sides of a triangle and the foot of the perpendicular from the vertex to the opposite side are concyclic.

Hint: D, E, F are the mid-points of the sides.

 $AM \perp BC$.

Join DE, DF, ME, MF and FE.

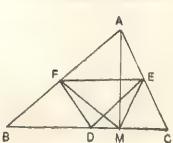

In the rt. ∠d △AMC, E is the mid-point of the hyp. AC.

ME=AE=EC

∴ ∠MAE=∠AME ...(1)

In the rt. \(\text{d} \text{ \(\Delta AMB, F is the mid-point of } \) the hyp. AB.

∴ MF=AF=FB

.. \(MAF=\) AMF

Adding (1) and (2), we have

 $\angle MAE + \angle MAF = \angle AME + \angle AMF$

i.e., $\angle A = \angle EMF$

AFDE is a parallelogram.

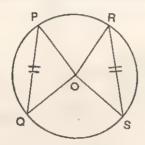

So $\angle A = \angle EDF$

. . ∠EDF=/EMF

So. F, D, M, E are concyclic.

THEOREM 62

Equal chords of a circle subtend equal angles at the centre.

Given

: Chords PQ and RS of a circle with centre O such that

PO=RS

PQ subtends ∠POQ and RS subtends ∠ROS at the centre O.

To Prove

Proof

 $\angle POQ = \angle ROS$: In $\triangle POQ$ and $\triangle ROS$

OP=OR

00=0S

PQ=RS

△POO≅△ROS

Then / POO= / ROS

[Radii of the same circle]

[Radii of the same circle]

[Given]

...(2)

[SSS Congruency Theorem]

[Corresponding parts of congruent triangles]

Proved.

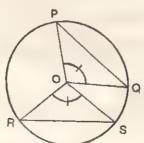

This theorem is also true for congruent circles. It can be stated as:

Equal chords of congruent circles subtend equal angle at the corresponding centres.

THEOREM 63

(Converse of Theorem 62)

If the angles subtended by two chords of a circle at the centre are equal, the chords are equal.

Given : Two chords PO and RS of a circle with centre O.

Chord PO subtends \(\subseteq POQ \) and chord RS subtends \(\subseteq ROS \) at the centre O such

that /POO=/ROS

To Prove

PO = RS

Proof

: In △POQ and △ROS

OP = OR

[Radii of the same circle]

00 = 0SIncl. / POO=Incl. / ROS [Radii of the same circle]

[Given]

△POO≅△ROS

[SAS Congruence Axiom]

Then PO=RS [Corresponding parts of congruent triangles]

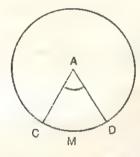

This theorem is also true for congruent circles. It can be stated as:

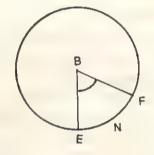

If the angles subtended by two chords of congruent circles at the corresponding centres are equal, the chords are equal.

Its proof is similar as above. Write down the proof.

THEOREM 64

In congruent circles two arcs that subtend equal angles at the corresponding centres are congruent.

Given

: Two congruent circles with centres A and B and \(CAD = \(EBF. \)

To Prove

: arc CMD≈arc ENF.

Proof

: Place the circle with centre A over the circle with centre B so that A falls on B

and AC falls along BE.

Since AC=BE, radii of congruent circles, the point C falls on the point E.

But / CAD= / EBF

[Given]

Then AD falls along BF.

Because AD=BF, radii of congruent circles, the point D falls on the point F.

The circles are congruent and their centres coincide.

.. These circles coincide with each other.

Thus, C falls on E, D falls on F and circles also coincide.

So, arc CMD coincides with arc ENF.

Hence arc CMD≅arc ENF.

Proved.

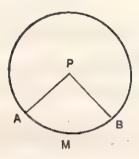

The above theorem is also true when congruent arcs are taken in the same circle. Then it is stated thus:

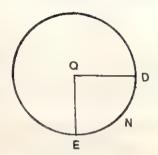

Two arcs of a circle are corgruent, if the angle subtended by them at the centre are equal,

THEOREM 65

(Converse of Theorem 64)

In congruent circles, if two arcs are congruent, they subtend equal angles at the corresponding centres.

Given

: Two congruent circles with centres P and Q.

Arc AMB≅Arc END.

To Prove

 $: \angle APB = \angle EQD.$

Proof

: Place the circle with centre P over the circle with centre Q so that P falls on Q and PA falls along OE.

Because PA=OE.

[Radii of congruent circles]

the point A falls on the point E.

Since the circles are congruent and their centres coincide, they also coincides.

But arc AMB≅arc END

[Given]

.. The point B falls on the point D.

Now P falls on Q and B falls on D.

... PB coincides with QD.

i.e.,* $\angle APB = \angle EQD$

Proved.

EXERCISE 7 (j)

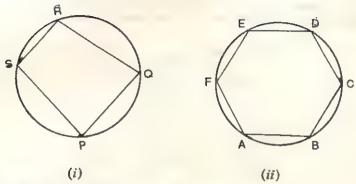

- 1. Prove that the bisector of an angle subtended by an arc at the centre of a circle bisects the arc.
- 2. Prove that the line joining the mid-point of an arc to the centre of a circle bisects the angle subtended by that arc at the centre.
- 3. P is a point on the circumference of a circle equidistant from radii OA and OB. Prove that arc AP≅arc BP.
- 4. Through O, the centre of a circle a radius. OC is drawn parallel to the chord AB. If AO produced meets the circle in D, prove that arc BC≅arc CD.

75. CYCLIC QUADRILATERAL

Points are said to be concyclic if they lie on the circumference of a circle.

A quadrilateral is said to be cyclic when all its vertices lie on the circumference of a circle.

Similarly a rectilinear figure is said to be cyclic when all it; vertices lie on the circum-

In Fig. (i), points P, Q, R, S are concyclic and in Fig. (ii) points A, B, C, D, E, F, are concyclic.

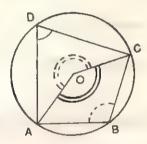

Also in Fig. (i), quadrilateral PQRS is cyclic and in Fig. (ii), ABCDEF is a cyclic hexagon.

The polygon is inscribed in the circle and the circle is circumscribed about the polygon.

THEOREM 66

The opposite angles of any quadrilateral inscribed in a circle i.e., a cyc.lie quadrilateral are, supplementary.

[C.B.S.E., 1980 (A.I)]

Given: A quadrilateral ABCD inscribed in a circle whose centre is O.

To Prove : $\angle A + \angle C = 2 \text{ rt. } \angle s$.

 $\angle B + \angle D = 2 \text{ rt. } \angle s.$

Const. : Join AO and OC.

Proof: Arc ABC subtends \(\times AOC at the centre O and \(\times ADC at a point D on the remaining part of the circumference. \)

 $\angle ADC = \frac{1}{2} \angle AOC$...(i)

Arc ADC subtends reflex \(\times AOC \) at the centre and \(\times ABC \) on the circumference.

 $\angle ABC = \frac{1}{9} \text{ reflex } \angle AOC$

Adding (i) and (ii), we have

 $\angle ADC + \angle ABC = \frac{1}{2} [\angle AOC + reflex \angle AOC]$

 $=\frac{1}{2}\times4$ rt. \angle s

=2 rt. \(\(\s \)

i.e., $\angle D + \angle B = 2 \text{ rt. } \angle s$

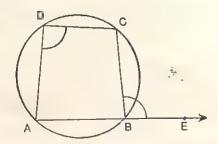

Similarly

 $\angle A + \angle C = 2 \text{ rt. } \angle s$

Proved.

[Angles around the point O]

Corollary: If one side of a cyclic quadrilateral is produced, the exterior angle so formed is equal to the interior opposite angle of the quadrilateral.

Given: A cyclic quadrilateral ABCD whose side AB is produced to E.

To Prove : Ext. ∠CBE=Int. opp. ∠ADC.

Proof : ∠ABC+∠CBE=180° ...(1) [Adjacent angles on a line ABE.]

∠ABC+∠ADC=180° ...(2) [Opposite angles of a cyclic quadrilateral

ABCD]

From (1) and (2), we have

∠ABC+∠CBE=∠ABC+∠ADC

∴ ∠CBE=∠ADC

Proved.

The converse of the above theorem is also true which can be stated without proof as under:

If the sum of any pair of opposite angles of a quadrilateral is 180°, then the quadrilateral is cyclic.

Or

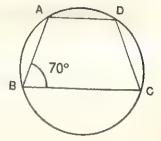

If the opposite angles of a quadrilateral are supplementary, its vertices are concyclic.

EXERCISE 7 (k)

(Section A)

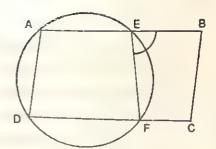

- 1. Prove that a parallelogram inscribed in a circle is a rectangle. [C.B.S.E., 1979 (Delhi)]
- 2. If the opposite sides of a cyclic quadrilateral are equal, prove that it is a rectangle.
- 3. If two sides of a cyclic quadrilateral are parallel, show that the other two sides are equal.
- 4. Two right-angled \triangle s ACB and ADB are on opposite sides of a common hypotenuse AB. If CD is joined, prove that \angle BAD= \angle BCD.
- 5. PQRS is a cyclic quadrilateral in which ∠SPQ=85°, ∠SQP=58°, calculate ∠PRQ.
- 6. Given a cyclic trapezium ABCD in which AD is parallel to BC and ∠ B=70° as shown in the adjoining figure.

Find $\angle BAD$ and $\angle BCD$.

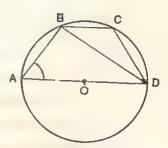

(Section B)

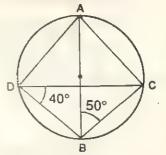

7. In the given figure, ABCD is a parallelogram. A circle passes through A and D cuts AB at E and DC at F. Given that ∠BEF=80°, find ∠ABC.

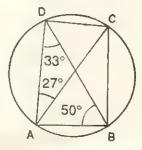

- 8. In the adjoining figure ABCD, if ∠BCD=125° and AD is the diameter of the circle, calculate
 - (i) ∠DAB
 - (ii) ∠ADB.

- 9. In the figure given alongside, if ∠ABC=50° and ∠BDC=40°, calculate
 - (a) ∠CDA,
 - (b) $\angle BAC$,
 - (c) ∠ BCA.

- 10. In the given figure, ABCD is a cyclic quadrilateral in which ∠DAC=27°, ∠DBA=50° and ∠ADB=33°, calculate
 - (a) $\angle DBC$,
 - (b) \angle DCB,
 - (c) \angle CAB.

- 11. A triangle is inscribed in a circle. Prove that the sum of the angles in the three segments exterior to the triangle is equal to four right angles.
- 12. In a cyclic hexagon ABCDEF, AB | ED and CD | AF; prove that BC | FE.

Hint: Join AD and CF.

(Section C)

- 13. ABCD is a parallelogram. A circle is drawn through A and B intersects AD and BC (produced if necessary) in E and F respectively. Prove that the points C, D, E, F are concyclic.
- 14. Two circles intersect at P and Q. Through P a line AB is drawn to meet the circles in A and B. Through Q a line CD is drawn to meet the circles in C and D. Prove that AC is parallel to BD.
- 15. Prove that the altitudes of a triangle are concurrent.

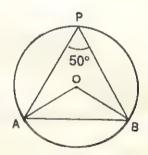

REVIEW EXERCISE VI

(Section A)

- 1. In answer to each of the following statements write True or False:
 - (a) Three circles can pass through three given points not in a line.
 - (b) The angle in a minor segment of a circle is an obtuse angle.
 - (c) The locus of the mid-points of all equal chords of a circle is a circle.
 - (d) The locus of mid-points of the radii of a circle is a circle.
- 2. Fill in the blanks to make each of the following statements true:
 - (a) Chords which are equidistant from the centre of a circle are.......
 - (b) An angle inscribed in a semi-circle is a...... [C.B.S.E., 1984 (A.I.)]
 - (c) The opposite angles of a cyclic quadrilateral are.....
 - (d) The line drawn through the centre to bisect a chord is..........
 - (e) Equal chords of a circle are.....from the centre. [C.B.S.E., 1985 (A.I.)]
 - (f) Equal chords of a circle subtend.....at the centre. [C.B.S.E., 1982 (A.I.)]
 - (g) If A, B and C are three non-collinear points, then exactly......circle(s) can be drawn through all of these points.

 [C.B.S.E., 1980 (A.I.)]
- 3. Fill in the blanks making each of the following a true statement:

[C.B.S.E., 1982 (Delhi)]

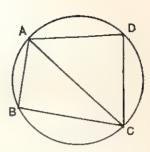

(b) In the figure, if O is the centre of the circle and ∠ACB=35° then ∠BDC=.....

[C.B.S.E., 1984 (A.I.)]

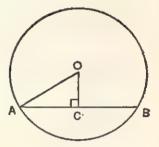

(c) In the figure, if ∠BAC=60° and ∠BCA=20°, then ∠ADC=.......

[C.B.S.E., 1983 (A.I.)]

(d) In the figure, if OC is perpendicular to AB, OA=5 cm and OC=3 cm, then AB=......

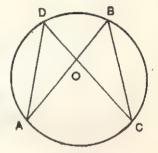

[C.B.S.E., 1981 (Delhi)]

4. Two chords AB and CD of a circle intersect each other at the point O inside the circle.

Prove that $\triangle AOD \sim \triangle COB$.

[C.B.S.E., 1986 (A.I.)]

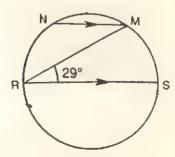

5. AB and CD are parallel chords of a circle whose diameter is AC. Prove that AB=CD.

[C.B.S.E., 1980 (Delhi); 1983 (A.1.)]

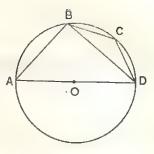

(Section B)

6. In the given figure, RS is a diameter of a circle. NM is parallel to RS and ∠MRS=29°.

Calculate \(RNM \) and \(NRM. \)

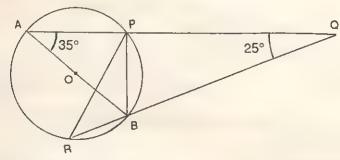

7. In the given figure, AB is a diameter of the circle. If $\angle BCD=140^{\circ}$, find $\angle DBA$.

- 8. ABC is an isosceles triangle and a line DE is drawn parallel to the base intersecting the sides in D and E. Prove that B, C, E and D lie on a circle. [C.B.S.E., 1984 (Delhi)]
- 9. PQ and RS are two equal chords of a circle with centre C. They are produced to meet at O. Show that OQ=OS. [C.B.S.E., 1982 (A.I.); 1984 (A.I.)]

Hint: Draw CM LPQ, CN LRS and join CO.

10. AB is a diameter of the circle APBR as shown in the figure. APQ and RBQ are two lines.

Find ∠PRB, ∠PBR and ∠BPR.

- 11. PQR is an isosceles triangle with PQ equal to PR. A circle passes through Q and R and intersects the sides PQ and PR at points S and T respectively. Prove that QR is parallel to ST.
- 12. Chords AB and CD intersect at right angles at a point inside the circle, and ∠BAC=40°.
 - (i) Sketch the chords AB and CD, and mark the angle BAC, in the circle.
 - (ii) From the figure, calculate the value of ∠ABD.

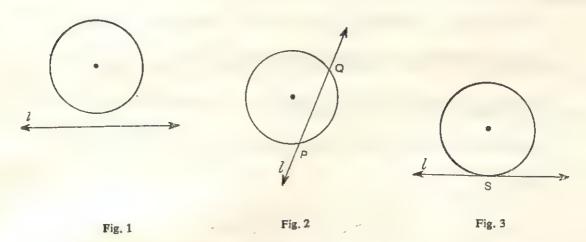

(Section C)

- 13. Points P, Q, R are taken on the circumference of a circle such that PS drawn at right-angles to PQ meets the circle at S; and RT drawn at right-angles to PR meets the circle at T. Prove that PQ=ST.
- 14. Prove that of any two chords of a circle, the one which is greater is nearer the centre.

TANGENT TO A CIRCLE

8.1. SECANT AND TANGENT

If a circle and a line are drawn on a plane, there are three different situations as shown below:

In Fig. 1, line I does not intersect the circle.

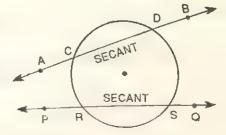

In Fig. 2, line *l* intersects the circle in two distinct points P and Q. Then we say that line *l* is a secant.

In Fig. 3, line l intersects the circle in only one point S.

Then we say that line I is a tangent.

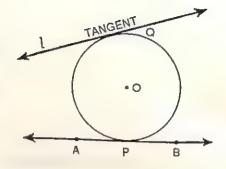

A line which intersects a circle in two distinct points is called a secant of the circle.

Here lines AB and PQ are two secants of the circle. Secant AB intersects the circle at C and D. Secant PQ intersects the circle at R and S.

A tangent to a circle is a line that intersects the circle in exactly one point.

Here line I and line AB are two tangents to the circle with centre O.

Since a tangent meets the circle at one and only one point, the tangent is said to touch

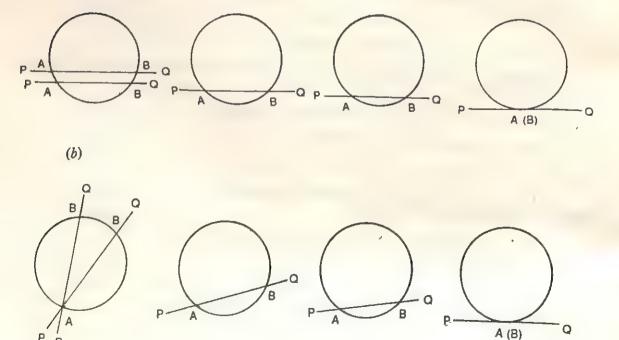

The point where a tangent touches the circle is called the point of contact.

Thus, in the figure, AB is a tangent to the circle, touching it at P. P is the point of contact. Also line I is a tangent to the circle at Q on it. Q is the point of contact.

A tangent may also be defined in another way. Examine the figures given below in which a secant PABQ cuts the circle at A and B.

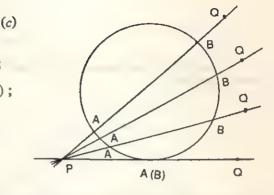

The secant is moved away from the centre in three ways:

(a)

(i) parallel to itself as shown in figures (a);

- (ii) about the point A as shown in figure (b);
- (iii) about the point P as shown in figure (c).

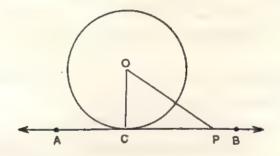

In all the cases, the points of intersection, A and B come nearer to each other and at one stage they coincide. Then the secant becomes a tangent to the circle.

Hence a tangent to a circle is the limiting position of a secant when the points of intersection with the circle coincide.

THEOREM 67

The tangent at any point of a circle and the radius through the point of contact [C.B.S.E., 1985 (A.I.)] are perpendicular to one another.

: A circle with centre O. Given

Line ACB is a tangent at C.

Line segment OC is the radius through the point of contact C.

OC 1 ACB. To Prove :

: Take any point P in AB. Const.

Join OP.

: Line AB is a tangent to the circle at C. Proof

> Every point in line AB except the point of contact C lies outside the circle. Then point P lies outside the circle.

Since the distance of an outside point from the centre is greater than the radius of the circle.

radius OC < OP.

Similarly it can be proved that OC is less than any other line segment drawn from O to AB.

.. OC is the shortest of all the line segments that can be drawn from the centre O to the tangent AB.

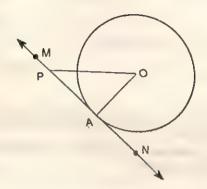

Hence OC 1 ACB.

Proved.

THEOREM 68

(Converse of Theorem 67)

A line drawn through the end of a radius and perpendicular to it is a tangent to the circle.

Given: A radius OA of a circle (O, r).

Line MN through A and perpendicular to OA.

To Prove: Line MN is a tangent to the circle.

Const. : Take a point P, different from A, on the line MN.

Join OP.

Proof : In $\triangle AOP$, $\angle OAP = 1$ rt. \angle

[MN L OA, given]

∴ ∠OAP > ∠OPA

∴ ¦OP > OA

i.e., OP > radius of the circle.

.. Point P lies outside the circle.

Thus, every point on the line MN except A lies outside the circle.

... the line MN meets the circle at only one point.

Hence the line MN is a tangent to the circle.

Proved.

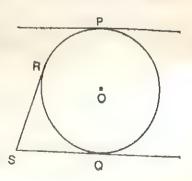

8'2. TANGENT-SEGMENTS

Tangents drawn at two points of a circle may be either parallel or intersecting.

In the adjoining figure, tangents at the points P and Q to the circle are parallel, while the tangents at the points Q and R intersect in a point S. We can also say that both the tangents at Q and R pass through the point S.

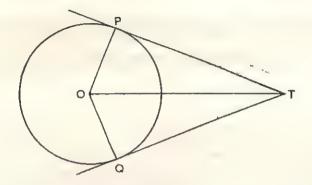

We can observe from the figure that no other tangent to the circle can be drawn to pass through the point S.

The line segments SQ and SR are called the tangentsegments and their lengths as length of tangents from S to the

THEOREM 69

The length of two tangents from an external point to a circle are equal,

Given

A circle C (O, r) and an external point T.

TP and TQ are two tangent segments from T to the circle C (O, r).

To Prove :

TP=TQ

Const.

Draw line segments OP, OQ and OT.

Proof

TP is a tangent segment to the circle C(0, r) and OP is the radius through the

point of contact P.

 $\triangle OPT = 90^{\circ}$

Similarly ∠OQT=90°

In the right $\triangle OPT$ and $\triangle OQT$

OP=OQ =

(Radii)

hyp. OT=hyp. OT

(Common)

.

 $\triangle OPT \cong \triangle OQT$ TP = TO

(RHS-Congruency Theorem)
(Corresponding parts of congruent triangles)

Proved.

In the proof of the above theorem we observe that

 $\angle TOP = \angle TOQ$ and $\angle PTO = \angle QTO$.

We can state these results as under:

If two tangents are drawn to a circle from a point outside the circle, then

- (i) they subtend equal angles at the centre, and
- (ii) they are equally inclined to the line segment joining the centre and the given point.

EXERCISE 8 (a)

(Section A)

1. Prove that the tangents at the extremities of a diameter of a circle are parallel.

[C.B.S.E., 1986 (A.I.)]

- 2. Prove that the line segment joining the points of contact of two parallel tangents to a circle passes through the centre.
- 3. Prove that a perpendicular to the tangent at the point of contact passes through the centre of the circle.
- 4. Prove that the tangents at the extremities of a chord of a circle make equal angles with the chord.

 [C.B S.E., 1984 (Delhi)]
- 5. If a quadrilateral is described about a circle, show that the sum of one pair of opposite sides is equal to the sum of the other pair.

(Section B)

- 6. Find the length of the tangent drawn to a circle of radius 3 cm from a point distant
- There are two concentric circles of radii 3 cm and 5 cm respectively. Find the length 7 of the chord of the outer circle which touches the inner circle.
- If all the sides of a parallelogram touch a circle, show that the parallelogram is a
- Tangents PT and PS are drawn to a circle of radius 5 cm from a point P outside the circle as shown in the adjoining figure.

If O is the centre of the circle and ∠TPO=30°, calculate

- (a) PO,
- (b) PT, correct to one decimal place,
- (c) the area of PTOS in cm2, correct to one decimal place.

Prove that only two tangents can be drawn to a circle from an external point.

Hint: Let P be the external point.

Join OP and draw a circle on OP as a diameter.

(Section C)

11. If a chord AB of a circle is parallel to the tangent at point P on it, prove that AP=BP.

Hint. Join OP, OA and OB.

△AOC≅ △BOC

12. A tangent CD to a circle at the point E on it meets two parallel tangents in point C and D. Prove that line segment CD subtends a right angle at the centre O.

Hint. Join OA, OB and OE.

△AOC≅ △EOC

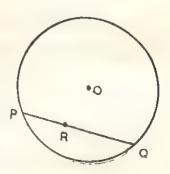

Also ∆BOD≅∆EOD

8'3. SEGMENTS OF A CHORD

Let PQ be a chord of a circle C(O, r), and R be a point on line segment PQ.

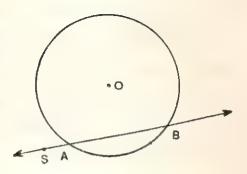

Observe that the point R lies inside the circle.

Then R is said to divide chord PQ internally into two segments PR and RQ.

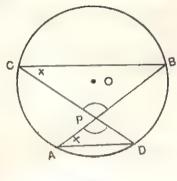

Let AB be a chord of a circle C(O, r) and S be a point on line PQ outside the circle.

Then S is said to divide chord AB externally into two segments SA and SB.

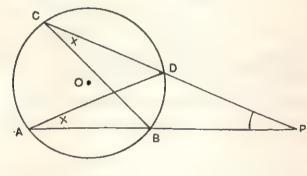

THEOREM 70

If two chords of a circle intersect inside or outside of the circle when produced, the rectangle formed by the two segments of one chord is equal in area to the rectangle formed by the two segments of the other.

(*i*)

(ii)

Given: Two chords AB and CD of a circle C(O, r) intersecting inside or outside, when

produced, of the circle at P.

To Prove: PA. PB=PC. PD.

Const. : Join AD and BC.

Proof : / BAD = / BCD

Proof : $\angle BAD = \angle BCD$ $i.e., \angle PAD = \angle PCB$

In △APD and △CPB

∠PAD=∠PCB

∠APD=∠CPB [Vertically opposite angles in figure (i)] and common angle in figure (ii)]

:. the remaining angles are equal.

So, \triangle APD and \triangle CPB are equiangular and hence they are similar.

$$\therefore \frac{PA}{PC} = \frac{PD}{PB}$$

i.e., PA . PB=PC . PD

Proved.

[Angles in the same segment]

[Proved above]

EXERCISE 8 (b)

(Section A)

 M is the mid-point of a chord AB; CD is another chord through M; prove that CM. MD=AM².

- 2. If two chords of a circle bisect each other inside the circle, prove that they are diameters of the circle.
- 3. Two chords AB and CD intersect at P inside a circle such that AP=3 cm, CP=1.5 cm and PD=8 cm. Find the length of PB.
- 4. In a circle with centre O, chords AB and CD intersect at P outside it such that AB=2 cm, BP=4 cm and DP=3 cm. Find the length of the chord CD.
- 5. If AB and CD are two chords intersecting at a point P inside the circle such that AP=CP, show that AB=CD.
- 6. If AB and CD are two chords which when produced meet at a point P and if AP=CP, show that AB=CD.

(Section B)

7. Through P, the point of intersection of two circles, two line segments APB and CPD are drawn, each passing through a centre of a circle and meeting the other circle. Prove that AP . PB:= CP . PD.

Hint. Join AC, and BD.

Points A, C, B and D are concyclic.

- 8. In an isosceles △ ABC, AB=AC. DE is drawn parallel to BC intersecting AB and AC in D and E respectively. Prove that AD.AB=AE.AC.
- 9. MN is a diameter of a circle and MP is any chord through M. A line segment is drawn perpendicular to MN meeting it in R and intersecting MP in S.

 Prove that MP.MS=MN.MR

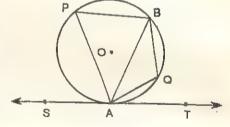

84. ANGLES IN THE ALTERNATE SEGMENT

Let SAT be the tangent line to a circle C(O, r) at point A on it.

Let AB be a chord of the circle through the point of contact A.

Chord AB makes two angles $-\angle$ BAT and \angle BAS with the tangent line SAT.

Let P and Q be any two points on the circle on either side of AB.

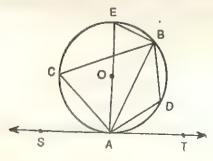

Then \angle APB is said to be an angle in the alterrate segment of \angle BAT. Similarly, \angle AQB is an angle in the alternate segment of \angle BAS.

THEOREM 71

If a chord is drawn through the point of contact of a tangent to a circle, then the angles which this chord makes with the given tangent are equal respectively to the angles formed in the corresponding alternate segments.

[C.B.S.E., 1982 (A.I.); 1984 (A.I.); 1980 (Delhi)]

Given: ST is a tangent line to a circle C(O, r) with point of contact A.

AB is a chord through the point of contact A.

C and D are points on the circle on the opposite sides of AB.

To Prove: \(\sum_BAT = \sum_ACB

and \(\(\mathbb{B} \text{AS} = \(\alpha \text{DB} \)

Const. : Draw the diameter AOE and join BE.

Proof. : AOE is a diameter of the circle.

[Construction]

∴ ∠ABE=90°

[Angle in a semi-circle]

Now in the right △ABE,

 $\angle AEB + \angle EAB = 90^{\circ}$...(1)

ST is a tangent line to the circle at A and AOE is a diameter through the point of contact A.

∴ ∠EAT=90°

i.e., $\angle EAB + \angle BAT = 90^{\circ}$...(2)

From (2) and (1), we get

 $\angle EAB + \angle BAT = \angle AEB + \angle EAB$

 \therefore $\angle BAT = \angle AEB$

∠AEB=∠ACB [Angles in the same segment]

∴ ∠BAT=∠ACB

Now ADBC is a cyclic quadrilateral.

... \(\text{ACB} + \text{BDA} = 180^\circ\) [Opposite angles]

i.e., $\angle BAT + \angle BDA = 180^{\circ}$...(3) [$\angle ACB = \angle BAT$ proved.]

Line segment AE stands on the line ST at A.

∴ ∠BAS+∠BAT=180° ...(4)

from (4) and (3), we get

 $\angle BAS + \angle BAT = \angle BAT + \angle BDA$

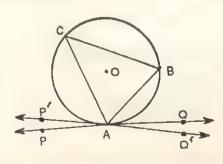

∴ ∠BAS=∠BDA

i.e., \(\sum_{BAS} = \sum_{ADB} \) Proved.

THEOREM 72

(Converse of Theorem 71)

If a line is drawn through an end point of a chord of a circle such that the angle which it makes with the chord is equal to the angle in the alternate segment, then the line is a tangent to the circle.

Given : AB is a chord of a circle C(0, r).

A line PAQ is drawn through A such that $\angle BAQ = \angle ACB$ in the alternate segment.

To Prove: PAQ is a tangent line to the circle at the point A.

Const. : If PAQ is not a tangent, draw tangent P'AQ' to the circle at A.

Proof: Now P'AQ' is tangent line to the circle at A and AB is a chord through the point of contact A.

∴ ∠BAQ'=∠ACB [Angle in the alternate segment]

But ∠BAQ=∠ACB [Given]

∴ ∠BAQ=∠BAQ′

This is impossible unless ray AQ' coincides with ray AQ.

Therefore P'AQ' coincides with PAQ or PAQ is the tangent to the circle at A. Proved.

EXERCISE 8 (c)

(Section A)

- 1. A \(\triangle ABC \) in which AB=BC, is inscribed in a circle. Prove that the tangent at B is parallel to the chord AC.
- 2. DE is a tangent line to a circumcircle of △ABC at A such that DE || BC. Prove that AB=AC. [C.B.S.E., 1981 (A.I.); 1982 (Delhi)]
- 3. A line segment PAB intersects a circle in A and B, and PC is a tangent segment to the circle. If ∠PCB=115°, find the ∠BAC.
- 4. The chord AB of a circle is produced to C and CT is a tangent segment to the circle. If BC=BT and ∠CBT=114°, find the angles of the △ATB.

(Section B)

- 5. A tangent to a circle is drawn parallel to a chord of the circle. Prove that the point of contact bisects the arc cut off by the chord.
- 6. Two circles intersect at A and B. From a point P on one of these circles two line segments PAC and PBD are drawn intersecting the other circle at C and D respectively. Prove that CD is parallel to tangent at P.

Hint: Join AB.

Let XPY be a tangent line to the circle at P.

$$\angle APX = \angle ABP$$

ext. \(ABP = int. opp. \(ACD \)

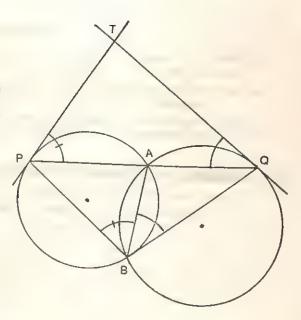

(Section C)

Two circles intersect at A and B, a line 7. segment PAQ intersects the circles at P and Q. If the tangents at P and Q intersect at T, prove that the points P, B, Q, T are concyclic.

Hint: Join AB, BP and BQ.

 $\angle APT = \angle ABP$ $\angle AQT = \angle ABQ$

 $\angle APT + \angle AQT = \angle PBO$ $\angle PBQ + \angle T = \angle APT + \angle AQT$ Then $+ \angle T = 2 \text{ rt. } \angle s.$

THEOREM 73

If PAB is a secant to a circle intersecting the circle at A and B and PT is a tangent segment, then PA . PB=PT2 [C.B.S.E., 1983 (A.I.)]

: A secant ABP to a circle C (O, r) intersecting it in A and B. Given

PT is a tangent segment to the circle from P.

: PA . PB=PT². To Prove Const. Join AT and BT.

PT is a tangent segment to the circle at T and TB is a chord through the point Proof

of contact T.

 $\angle PTB = \angle BAT$ [Angle in the alternate segment]

 $\angle PTB = \angle PAT$ i.e., Now in △ PBT and △ PTA

 $\angle PTB = \angle PAT$ [Proved above] $\angle BPT = \angle TPA$ [Common angle]

... the remaining angles are equal.

So, $\triangle PBT$ and $\triangle PTA$ are equiangular and hence they are similar.

$$\frac{PB}{PT} = \frac{PT}{PA}$$
i.e., PA . $PB = PT^2$ Proved.

EXERCISE 8 (d)

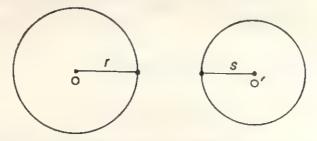

- 1. PQ is a tangent segment to a circle at point Q and PBA is a secant intersecting the circle at B and A. If BP=4 cm, AB=12 cm, find the length of PQ.
- 2. (a) If from any point on the common chord produced, of two intersecting circles, tangents be drawn to the circles, prove that they are equal.
 - (b) Two circles intersect each other in points A and B. If PS and PT are tangents to the two circles from a point P on the line containing A and B, show that PS=PT.

 [C.B.S.E., 1985 (A.I.)]

8.5. COMMON TANGENTS TO TWO CIRCLES

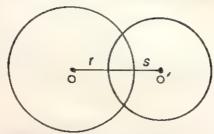

Given two circles C(O, r) and (O', s). There are three possibilities.

(1) The circles do not intersect, as shown below:

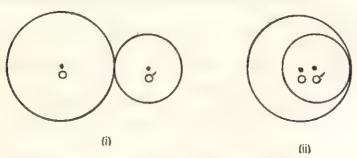

We observe that the distance between their centres is greater than the sum of the radii of the circles. So, OO'>r+s.

(2) The circles intersect in two points, as shown below:

We observe that the distance between their centres is less than the sum of the radii of the circles. So, OO' $\ll r+s$.

(3) The circles intersect in only one point, as shown below:

When two circles intersect in only one point, they are said to touch each other.

Two circles can touch each other in two ways. See Figs. (i) and (ii) above.

When each of the touching circles lies outside the other, they are said to touch one another externally.

[See Fig. (i)]

When one of the touching circles is within the other, they are said to touch one another internally.

[See Fig. (ii)]

The point at which the circles meet is called the point of contact.

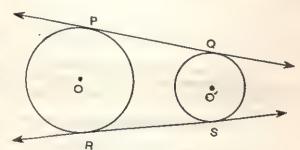

The line joining their centres is called the line of centres.

If a line touches each of two given circles, it is called a common tangent to the circles.

If two circles do not intersect, two pairs of common tangents can be drawn to the two circles.

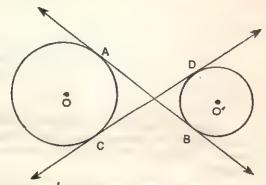

If the circles lie on the same side of the common tangent, the tangent is called a direct common tangent.

In the figure, PQ and RS are two direct common tangent lines.

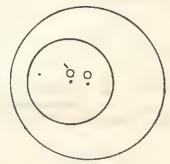

If the circles lie on opposite sides of the common tangent, the tangent is called a transverse common tangent or indirect common tangent.

In the figure, AB and CD are two transverse common tangent lines.

When one circle is inside the other circle completely, no common tangent can be drawn to the two circles.

Note that common tangents to two circles will exist if one circle does not lie inside the other.

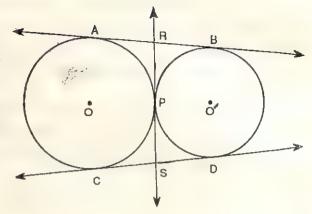

Let us now discuss some other cases.

(i) If two circles touch externally, there will a pair of direct common tangents and also a common tangent at the point of contact of the circles which will be the transverse common tangent.

Here lines AB and CD are direct common tangents and line RS is a transverse common tangent.

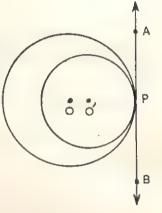

Are points O, O' and P collinear?

(ii) If two circles touch internally, there will be no transverse common tangents, but only one common tangent at the point of contact which will be direct common tangent to the two circles.

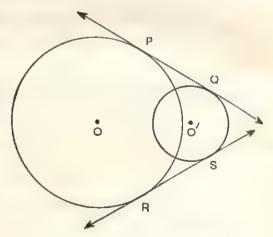

Here AB is the only common tangent line to the two circles.

Are points O, O' and P collinear?

(iii) If two circles intersect in two points, there will be only one pair of direct common tangents. They will not have any transverse common tangent.

Here PQ and RS are two direct common tangents.

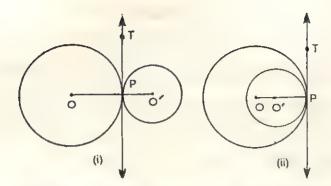

We have observed that the two centres and the point of contact of the two touching circles are collinear and there will be a common tangent to these circles at the point of contact. We shall now prove these facts.

THEOREM 74

If two circles touch each other, the point of contact lies on the line through the centres.

[C.B.S.E., 1980 (A.I.); 1985 (A.I.); 1984 (Delhi); 1985 (Delhi)]

Given: Two circles with centres O and O' touching each other at P externally

[Fig. (i)] or internally [Fig. (ii)].

To Prove: Points O, P and O' lie on the same line.

Const. : Join OP and PO'.

Draw a common tangent PT to the circles at P.

Proof: For the circle with centre O, PT is a tangent line and PO is the radius through

the point of contact.

 $\angle OPT = 90^{\circ}$ i.e., PO $\perp PT$.

For the circle with centre O', PT is a taugent and PO' is the radius through the point of contact P.

 $\angle O'PT=90^{\circ}$ i.e., PO' \perp PT.

Thus, PO and PO' are both perpendicular to line PT at the point P.

But through a given point one and only one perpendicular can be drawn to the given line.

Hence PO and PO' must be the same line.

So, O, P and O' lie on the same line. Proved.

Corollary: The two circles C (O, r) and C (O', s) will touch

(i) externally, if and only if, OO' = r + s, and

(ii) internally, if and only if, OO' = r - s, when r > s

OO' = s - r, when s > r.

EXERCISE 8 (e)

(Section A)

- 1. Two circles of radii 1.8 cm and 24 mm are drawn touching each other (a) externally, or (b) internally. Find the distance between their centres in each case.
- 2. Three circles of radii 10 mm, 15 mm and 20 mm respectively are drawn so that each touches the other two externally. Find the lengths of the sides of the triangle whose vertices are the centres of the circles.
- 3. Three circles with equal radii touch each other externally. Show that the triangle formed by joining their centres is equilateral.
- 4. Prove that the tangents at the point of contact of two circles touching each other externally bisects their direct common tangents.
- 5. Two circles touch at P. Through P a line segment is drawn cutting the circle at M and N. Prove that the radii through M and N are parallel.
- 6. Two circles touch each other externally at P and through P a line segment APB is drawn cutting the circles at A and B. Prove that the tangents at A and B are parallel.

(Section B)

- The circles with centres A, B and C touch one another externally. If AB=17 mm, 7. BC=22 mm and CA=19 mm, find the radii of the circles.
- Two circles touch externally at C and a line segment AB touches them at A and B. 8. Prove that AB subtends a right-angle at C.

Hint: At C, draw a common tangent to the circles.

Two circles touch each other internally at P and a line AD intersects the outer circle at 9. A and D and the inner circle at B and C. Prove that $\angle APB = \angle CPD$.

Hint: Draw a common tangent to the circle at the point of contact P.

10. Two circles intersect each other at the points A and B. CD is a direct common tangent as shown in the adjoining figure. Prove that the angles subtended by the segment CD at A and B are supplementary.

D

C

[C.B.S.E., 1984 (A.I.)]

(Section C)

Two circles touch each other at P. APC and BPD are lines through P that meet the 11. two circles in A, B and C, D respectively.

Show that (i) $\triangle PAB \sim \triangle PCD$

[C.B.S.E., 1984 (A.I.)]

(ii) AB || CD.

Hint: Draw a tangent line to the circles at P.

In a ABC, a line segment PQ is drawn parallel to base BC intersecting AB and AC 12. in P and Q respectively. Prove that the circumcircles of the \(\triangle ABC \) and \(\triangle APQ \) touch each other at A.

Hint: At A, draw a tangent line to the circle ABC.

- PP' and QQ' are two direct common tangents to two circles intersecting in points A and B. The common chord AB produced intersects PP' in R and QQ' in S. Prove that $RS^2 = PP'^2 + AB^2$.
- AB is a line segment and M is its mid-point. Semi-circles are drawn with AM, MB and AB as diameters on the same side of the line AB. A circle C (O, r) is drawn so that it touches all the three semi-circles. Prove that AB=6r.

REVIEW EXERCISE VII

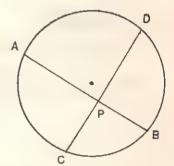

(Section A)

- 1. Fill in the blanks to make each of the following statements true:
 - (a) The line through a point on a circle......to the radius through the point, is the tangent line to the circle at that point. [C.B.S.E., 1987 (A.I.)]
 - (b) The lengths of the two tangents from an external point to a circle are........

 [C.B.S.E., 1986 (A.I.); 1984 (A.I.); 1986 (Delhi)]
 - (c) A line which touches two given circles is called a......to the circles.

 [C.B.S.E., 1986 (A.L.)]
 - (d) If two circles touch each other, the point of contact lies on the line joining their.......
 - (e) Two circles C (O, r) and C (O', s) will touch each other externally, if and only if, OO' is equal to........
 - (f) If two circles intersect in two points, they will have only one pair of......common tangents.
 - (g) In the figure, if AP=4 cm, BP=3 cm, and CP=2 cm, then PD=.....cm.

[C.B.S.E., 1987 (Delhi)]

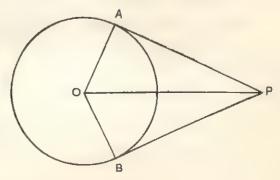

(h) In the figure, SPT is a tangent to the circle and ∠SPR=120°, then ∠RQP=......

[C.B.S.E., 1986 (A.I.)]

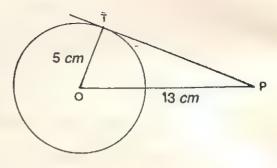

(i) PA and PB are tangents to a circle with centre O. If ∠OPA=30°, then ∠AOB is......

[C B.S.E., 1986 (Delhi)]

(i) In the figure, if PT is a tangent to a circle whose centre is O, then length of PT is.....cm.

[C.B.S.E., 1983 (Delhi)]

(Section B)

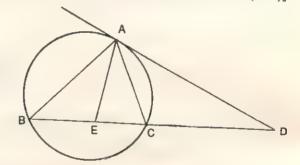

- Prove that there is one and only one tangent at any point on the circle. 2.
- [C.B.S.E., 1986 (A.I.)] PQ and PR are equal chords of a circle. Prove that tangent at P to the circle is parallel to chord QR. [C.B.S.E., 1986 (A.I.)]
- The incircle of a triangle ABC touches the sides BC, CA and AB at P, Q and R 4. respectively.

Show that $AR+BP+CQ=AQ+CP+BR=\frac{1}{2}$ (perimeter of \triangle ABC)

[C.B.S.E., 1986 (Delhi); 1978 (Delhi)]

- 5. A circle is touching side BC of a ABC at P and is touching AB and AC produced at Q and R respectively. Prove that AR is half the perimeter of ABC. [C.B.S.E., 1987 (Delhi); 1986 (A.I.)]
- 6. In the figure, DA is a tangent and DCB is a secant to a circle. If the bisector of \(CAB \) intersects BC at E, show that DA = DE.

[C.B.S.E., 1978 (Delhi); 1986 (A.I.)]

(Section C)

- 7. In a right triangle ABC, a circle with a side AB as diameter is drawn to intersect the hypotenuse AC in P. Prove that the tangent to the circle at P bisects the side BC. Hint: Join BP.
- The points of contact of a common tangent to two circles which intersect at C and D are A and B. If AC, BD meet in M and AD, BC meet in L, prove that C, L, D and M [C.B.S.E., 1986 (Delhi)]

GEOMETRICAL CONSTRUCTIONS

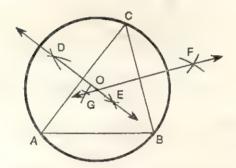

We have already studied about some geometrical constructions in Class IX. We shall now learn some more geometrical constructions involving circles.

9.1. CONSTRUCTION OF CIRCUMSCRIBED AND INSCRIBED CIRCLES OF TRIANGLES

CONSTRUCTION 24

To circumscribe a circle about a given triangle.

Construct a triangle with sides 35 mm, 32 mm and 40 mm. Draw the circumcircle of the triangle.

Given

: Sides of a triangle are 35 mm, 32 mm and 40 mm.

Required

: (i) To construct the triangle.

(ii) To draw the circumcircle of the triangle.

Const.

- : (i) (1) Construct \triangle ABC with the given sides.
 - (ii) (1) Draw DE, the right-bisector of CA.
 - (2) Draw FG, the right-bisector of BC.
 - (3) Let these right-bisectors intersect each other at O.
 - (4) With O as centre and OA as radius draw a circle.

The circle passes through A, B and C and is the required circle.

Proof

: Since O is on DE, the right-bisector of AC,

Since O is on FG, the right-bisector of BC,

From (1) and (2), we have OA=OB=OC

i.e., O is equidistant from A, B and C.

Hence a circle with centre O and radius equal to OA will pass through A, B and C.

The circle which passes through all the vertices of a triangle is called its circum-circle.

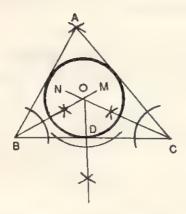

The radius of the circum-circle is called circum-radius and its centre is called circum-centre.

Note: The circum-centre of a triangle lies inside the triangle, on the mid-point of a hypotenuse, or outside the triangle, according as the triangle is an acute-angled, a right-angled or an obtuse-angled triangle.

CONSTRUCTION 25

To inscribe a circle in a given triangle.

Construct a \triangle ABC such that BC=5 cm, CA=4.6 cm, and AB=3.8 cm. Inscribe a circle in the triangle.

Given

: \triangle ABC in which BC=5 cm, CA=4.6 cm, and AB=3.8 cm.

Required

: (i) To construct the \triangle ABC.

Const.

(ii) To draw its in-circle.
: (i) (1) Construct the △ABC with given sides.

(ii) (1) Draw BM, the bisector of $\angle B$.

(2) Draw CN, the bisector of ∠C.

(3) Let these bisectors intersect each other at O.

(4) From O, draw OD \(\pm\)BC.

(5) With centre O and radius OD, draw a circle. The circle touches the sides of the △ABC and is the required circle.

The circle which is drawn inside the triangle so as to touch each of the sides is called its In-circle.

The radius of the in-circle is called the In-radius and its centre is called the In-centre.

EXERCISE 9 (a)

(Section A)

- 1. Perpendicular bisectors of the sides AB and AC of a triangle ABC meet in O.
 - (i) What do you call the point O?
 - (ii) What is the relation between the distances OA, OB and OC?
 - (iii) Does the perpendicular bisector of BC rass through O?
 - (iv) What do you call the point where the perpendiculars drawn from the vertices A, B and C of the triangle ABC to their opposite sides meet?

- 2. The bisectors of angles A and B of a scalene triangle ABC meet at O.
 - (i) What is the point O called?
 - (ii) OR and OQ are drawn perpendicular to AB and CA respectively.

 What is the relation between OR and OQ?
 - (iii) What is the relation between \(ACO \) and \(BCO \)?
- 3. Using ruler and compasses only inscribe a circle in the given triangle and measure its radius.

(Section B)

- Construct a triangle with sides 26 mm, 28 mm and 30 mm. Circumscribe a circle about it and measure its radius.
- 5. Draw a circle passing through the vertices of an equilateral triangle whose side is 2.2 cm.
- 6. Construct a triangle ABC with BC=3 cm, ∠A=75°, ∠B=60°. Draw its circumcircle and measure its radius.
- 7. Draw a square with side 3'2 cm. Inscribe a circle in it.
- 8. Draw a triangle whose sides are 28 mm, 26 mm, and 30 mm. Inscribe a circle in it and measure its radius.
- 9. Construct a right-angled triangle having hypotenuse=2.6 cm, and a side=2.4 cm. Draw its in-circle and measure the in-radius.
- 10. Draw an equilateral triangle on a side of 4 cm and draw the inscribed and circumscribed circles. Find by measurement the radii of the two circles.

(Section C)

- 11. Draw a triangle whose sides are 31 mm, 42 mm and 53 mm. Draw its in-circle and circum-circle and measure the distance between the centres.
- 12. Using ruler and compasses only:
 - (a) Construct a triangle ABC with the following data:

 Base AB=7 cm, BC=6.5 cm and \(CAB=60^{\circ} \).
 - (b) In the same figure, draw a circle which passes through the points A, B and C and mark its centre O.
 - (c) Draw a perpendicular from O to AB which meets AB in D.
 - (d) Prove that AD=BD.

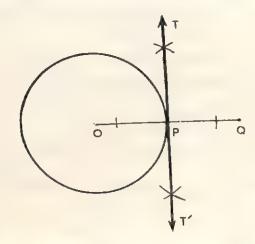

9.2. CONSTRUCTIONS OF TANGENTS

For the construction of tangents, the following properties which have been proved earlier, must be remembered.

- 1. Only one tangent can be drawn at a point on a circle.
- 2. A tangent is perpendicular to the radius through the point of contact.
- 3. Only two tangents can be drawn to a circle from a point outside the circle. They will be equal.

CONSTRUCTION 26

To draw a tangent to a given circle at a point on it.

Given

: A circle with centre O.

A point P on it.

Required Const.

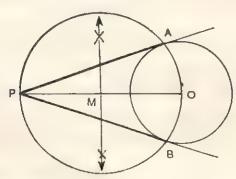

: To draw a tangent to the circle at P.

: (1) Join OP and produce it to Q. (2) At P, draw TPT' \(\preceq\) OQ.

Then TPT' is the required tangent line.

CONSTRUCTION 27

To draw tangents to a given circle from a point outside the circle.

Given

: A circle with centre O.

A point P outside the circle.

Required

: To draw tangents to the circle from P.

Const.

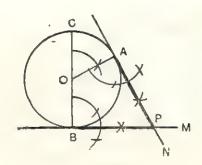

- : (1) Join OP.
 - (2) Bisect OP at M.
 - (3) With M as centre and MO as radius draw a circle cutting the given circle at A and B.
 - (4) Join PA and PB.

Then PA and PB are the two required tangents.

CONSTRUCTION 28

To draw tangents to a circle inclined at a given angle.

Traw a circle of radius 15 mm. Draw two tangents to it inclined at an angle of 60° to each other.

Steps of Construction:

- (1) Draw any diameter BOC.
- (2) Draw a radius OA making ∠AOC=60° (=the given ∠).
- (3) At B, draw BM 1 radius OB.
- (4) At A, draw AN 1 radius OA.
- (5) Let these perpendiculars intersect each other at P.

Then PA and PB are the required tangents.

Note: In order to draw tangents to a given circle inclined at a given angle draw two radii making an angle equal to the supplement of the given angle at the centre. Then draw tangents (1s) at the ends of these radii.

EXERCISE 9 (b)

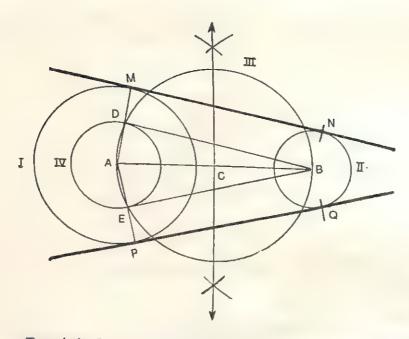

- 1. Draw a circle with the radius 1.9 cm and also draw a tangent to it at a point P on its circumference.
- Draw a tangent to a circle of 4 cm as diameter from a point P outside the circle. 2.
- Using ruler and compasses only construct the tangents to the given circle from the point P. Measure the length of any one of them. 3.
- Draw a circle of radius 18 mm. Take a point P, 27 mm away from the centre. Draw tangents to the circle from this point. Calculate the length of the tangents.
- Draw a circle of radius 2.4 cm. Draw two tangents to the circle such that the angle between them is equal to (a) 30°, (b) 45°.
- From a point P on the circumference of a circle of radius 3 cm, draw a chord whose distance is 2 cm from the centre.
- Draw a circle of radius 4 cm. Mark its centre as C and mark a point D such that CD=7 cm. Using ruler and compasses only, construct the two tangents from D to the 7. circle. Measure the length of one of them.
- 8. Draw a circle of radius 3 cm. Take a point P, 5 cm away from its centre. From P draw tangents to the circle and measure the length of the tangent. [C.B.S.E., 1986 (Delhi)]

9.3. CONSTRUCTION OF COMMON TANGENTS

CONSTRUCTION 29

To draw direct common tangents to two given circles.

Given two circles of radii 2.1 cm and 1 cm with their centres 5 cm apart. Draw direct common tangents to the two circles and measure the length of the tangents.

Given

: Two circles I and II with centres A and B, and with radii 2.1 cm and 1 cm.

Distance between the centres (AB)=5 cm.

Required

: To draw the direct common tangents to the circles.

Const.

- : (1) Bisect AB at C.
 - (2) With C as centre and radius AC, draw a circle (III).
 - (3) With centre A and radius=(2.1-1) cm or 1.1 cm (=the difference of radii of given circles), draw another circle (IV) cutting the circle (III) at
 - (4) Join AD and produce it to meet the circle (1) at M.
 - (5) Join AE and produce it to meet the circle (I) at P.
 - (6) With centres M and P and radius BD or BE, draw arcs cutting the circle (II) at N and Q respectively.
 - (7) Join MN and PQ.

Then MN and PQ are the required tangents.

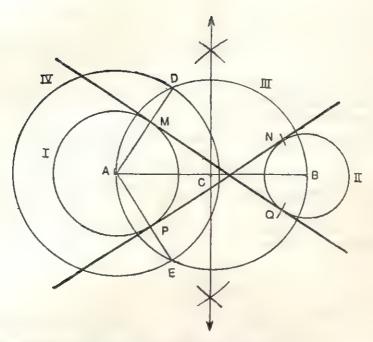

Measurement: MN=4.9 cm nearly and PQ=4.9 cm nearly.

Note: In step (6) the usual practice is to draw BN || AM and BQ || AP in the same sense. But in drawing parallels, accuracy is reduced. Hence, it is preferred to draw arcs as above.

CONSTRUCTION 30

To draw transverse common tangents to two given circles.

Given two circles of radii 1.6 cm and 1 cm with their centres 4.9 cm apart, Draw transverse common tangents to the circles and measure the length of the tangents.

Given

: Two circles with the centres A and B and radii 1.6 cm and 1 cm respectively. Distance between the centres (AB)=4.9 cm.

Required

: To draw the transverse common tangents to the circles.

Const.

- : (1) Bisect AB at C.
 - (2) With C as centre and radius AC, draw a circle (III).
- (3) With A as centre and radius=(1.6+1) cm or 2.6 cm (=the sum of the radii of given circles) draw another circle (IV) cutting the circle (III) at D and E.
- (4) Join AD cutting the circle (I) at M.
- (5) Join AE cutting the circle (I) at P.
- (6) With centres M and P and radius BD or BE, draw arcs cutting the circle (II) on the other side at Q and N respectively.
- (7) Join MQ and PN.

 Then MQ and PN are the required tangents.

Measurements: MQ=4'1 cm nearly, PN=4'1 cm nearly.

EXERCISE 9 (c)

- 1. Draw two circles with radii 2 cm and 3 cm with their centres 7 cm apart.
 - (a) Draw a direct common tangent and a transverse common tangent.
 - (b) Calculate the length of the direct common tangent.
- 2. Find the length of the direct common tangent to two circles of radii 3 cm and 5 cm with their centres 10 cm apart.
- 3. Draw two circles of radii 1.6 cm and 3 cm respectively, and with centres 5.6 cm apart. Draw the direct common tangents. Measure their lengths.
- 4. Draw two circles of radii 3.6 cm and 1.4 cm, their centres being 5.4 cm apart. Draw the transverse common tangents to these circles. Measure the length of these tangents.

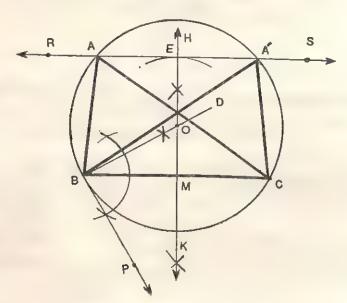

- Construct two equal circles with radius 1.8 cm each and centres 4.4 cm apart. Draw 5. direct common tangents to them and write down their length.
- Draw two circles of radii 4.7 cm and 3.1 cm with their centres 7.8 cm apart. Draw all the common tangents to the two circles and measure the length of a direct common tangent.
- 7. Draw two circles with radii 2.5 cm and 3 cm having their centres 6 cm apart. Draw a direct common tangent and a transverse common tangent to the circles. Measure the length of the direct common tangent.

9.4. CONSTRUCTION OF TRIANGLES HAVING GIVEN VERTICAL ANGLE

CONSTRUCTION 31

To construct a triangle whose base, vertical angle and altitude through the vertex are given.

Construct a △ ABC, having given base BC=4.8 cm, the vertical angle A=60° and the altitude through the vertex = 3 cm.

Steps of Construction:

- (1) Draw a line segment BC equal to 4.8 cm.
- (2) Make \(PBC=60^\circ\).
- (3) Draw line HK, the right bisector of BC, intersecting BC in M.
- (4) Draw BD 1 BP.
- (5) Let BD and HK intersect at a point O.
- (6) With O as centre and OB as radius, draw a circle.

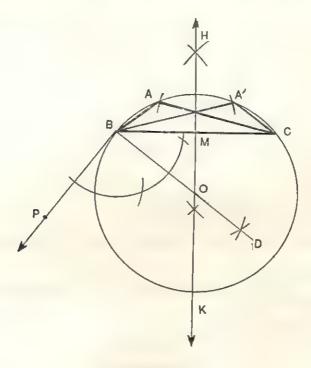

[Observe that the segment BAA'C contains an angle of 60°]

- (7) On the line HK mark segment ME=3 cm (length of the altitude).
- (8) Through E, draw line RS 1 line HK so that RS | BC.
- (9) Let line RS intersect the circle at A and A'. (10) Join AB, AC and A'B, A'C.
- Then A ABC or A A'BC is the required triangle.

CONSTRUCTION 32

To construct a triangle whose base, vertical angle and median through the vertex are given.

Construct a triangle, having given the base = 4.5 cm, vertical angle = 120° and the median through the vertex = 1.5 cm.

Steps of Construction:

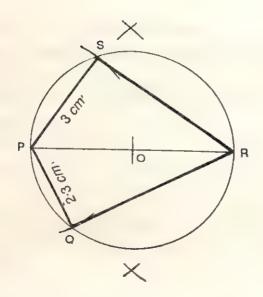

- (1) Draw a line segment BC equal to 4.5 cm.
- (2) Make ∠PBC=120°.
- (3) Draw line HK, the right-bisector of BC, intersecting BC in M.
- (4) Draw BD ⊥ BP.
- (5) Let BD and HK intersect at a point O.
- (6) With O as centre and OB as radius draw a circle.
- (7) With M, the mid-point of BC, as centre and radius equal to 1.5 cm draw arcs intersecting the circle at A and A'.
- (8) Join AB, AC and A'B, A'C.

Then $\triangle ABC$ or $\triangle A'BC$ is the required triangle.

CONSTRUCTION 33

To construct a cyclic quadrilateral with one vertex angle as a right angle.

Construct a cyclic quadrilateral PQRS in which PR=5 cm, PQ=2.3 cm, PS=3 cm and \angle S=90°.

Steps of Construction :

- (1) Draw a line segment PR equal to 5 cm.
- (2) On PR as diameter draw a circle.
- (3) With P as centre and radius equal to 2.3 cm, draw an arc intersecting the circle at O.
- (4) Join PQ and QR.
- (5) With P as centre and radius equal to 3 cm, draw an arc opposite to Q intersecting the circle at S.
- (6) Join PS and SR.
 Then PQRS is the required quadrilateral.

EXERCISE 9 (d)

- 1. Construct a ΔABC, having given base BC=4.5 cm, the vertical angle A=60° and one of the sides=3.3 cm.
- 2. Construct a cyclic quadrilateral ABCD in which AC=5 cm, AB=2 cm, CD=3 cm and \(B=90^{\circ}. \)
- 3. Construct a triangle ABC in which BC=5 cm, $\angle A=50^{\circ}$ and altitude through A=4 cm.
- 4. Construct a triangle ABC in which BC=6 cm, $\angle A$ =70°, and median through A=4 cm.
- 5. Construct a ΔABC, having given base BC=4 cm, ∠A=60°, and altitude through the vertex=2'8 cm.
- 6. Construct a triangle having base=3.5 cm, vertical angle 40° and median through the vertex 2.5 cm.
- 7. Construct a cyclic quadrilateral ABCD in which AC=6 cm, ∠ABC=55°, AB=2·3 cm and AD=3 cm.
- 8. Construct a cyclic quadrilateral ABCD with the following data:

diagonal AC=4 cm, \(\triangle ABC=135^\circ\), AB=CD=3 cm.

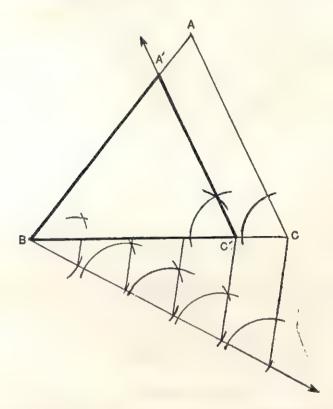

9.5. CONSTRUCTION OF SIMILAR FIGURE

We have learnt about similarity of two figures. We shall now construct some geometrical figures similar to given figures.

CONSTRUCTION 34

To construct a triangle similar to a given triangle as per the given scale

Construct a triangle similar to a given triangle ABC with its sides equal to \$th of the corresponding sides of AABC.

Steps of Construction :

- (1) Divide the base BC of the △ABC into five equal parts.
- (2) Let C' be a point on BC such that $BC' = \frac{4}{5} BC$.
- (3) Through C', draw a ray parallel to CA intersecting BA at A'. Then $\triangle A'BC'$ is the required triangle.

Proof. Line segments A'C' and AC are parallel to each other.

∴ ∆A'BC' and ∆ABC are equiangular.

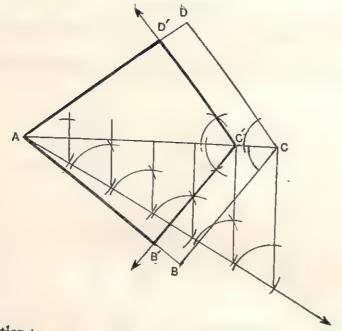

$$\therefore \frac{A'B}{AB} = \frac{BC'}{BC} = \frac{C'A'}{CA} = \frac{4}{5}$$

i.e., △A'BC' is similar to △ABC.

CONSTRUCTION 35

To construct a quadrilateral similar to a given quadrilateral as per the given scale factor.

Construct a quadrilateral similar to a given quadrilateral ABCD with its sides \$th of the corresponding sides of ABCD.

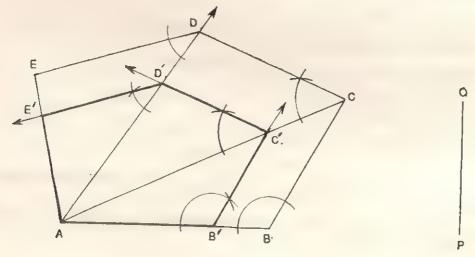

Steps of Construction:

- (I) Join AC.
- (2) Divide line segment AC into six equal parts.
- (3) Let C' be the point on AC such that $AC' = \frac{5}{6}AC$.
- (4) Through C', draw a ray parallel to CD intersecting AD in D'.
- (5) Through C', draw a ray parallel to CB intersecting AB in B'. Then AB'C'D' is the required quadrilateral.

CONSTRUCTION 36

To draw a polygon similar to a given polygon on a side of given length.

Construct a pentagon similar to given pentagon ABCDE with side corresponding to AB and equal to PQ.

Steps of Construction:

- (I) Join AC and AD.
- (2) Mark a point B' on AB such that AB'=PQ.
- (3) Through B', draw a ray parallel to BC intersecting AC in C'.
- (4) Through C', draw a ray parallel to CD intersecting AD in D'.
- (5) Through D', draw a ray parallel to DE intersecting AE in E'.

 Then AB'C'D'E' is the required pentagon.

EXERCISE 9 (e)

- 1. Construct a triangle similar to a given \triangle ABC with its sides equal to ${}_{4}^{3}$ th of the corresponding sides of \triangle ABC.
- A triangle ABC is such that AB=4 cm, BC=5 cm and AC=6 cm. Construct a triangle similar to the given △ABC such that each of its side is ²/₃rd of the corresponding side of the given triangle.
- 3. Construct a quadrilateral similar to a given quadrilateral ABCD with its sides 4th of the corresponding sides of quad. ABCD.
- 4. Draw a quadrilateral ABCD such that AB=4.5 cm, BC=4.8 cm, CD=4 cm, DA=4.3 cm and ∠A=75°. Draw another quadrilateral similar to the given quadrilateral on a line segment of 3 cm, corresponding to side AB.
- 5. Construct any pentagon ABCDE. On a line segment PQ, 3 cm long, construct another pentagon PQRST similar to the pentagon ABCDE.

REVIEW EXERCISE VIII

(Section A)

- 1. For each of the following statements write 'True' or 'False' as appropriate:
 - (a) A direct common tangent can always be drawn to any two given circles.
 - (b) The centre of the circumcircle of a right-angled triangle is the mid-point of its hypotenuse.
 - (c) The centre of incircle of a given triangle is always in the interior of the circle.
 - (d) A figure similar to any rectilinear figure can be drawn by dividing the latter into triangles and then constructing similar triangles to these.

(Section B)

- 2. Construct a circle with centre O and radius as 2.5 cm. Draw a tangent at any point on the circle.
- 3. Use ruler and compasses to draw two tangents to a circle of radius 2.5 cm from a point P at a distance of 6 cm from its centre. Write also the steps of construction.

 [C.B.S.E., 1987 (A.I.)]
- 4. Construct a circle of radius 3 cm. Draw two tangents to this circle such that the angle between the tangents is 60°.
- 5. Using ruler and compasses, draw a tangent at a point P of a circle of radius 4 cm without using the centre. Also write the steps of construction. [C.B.S.E., 1988 (Delhi)]
- 6. Using ruler and compasses, draw a △ABC in which BC=7 cm, CA=5 cm and AB=6 cm and construct its circumcircle. Also write the steps of construction. [C.B.S.E., 1987 (Delhi)]

(Section C)

- 7. The centres of two circles of radii 2 and 3 cm respectively are 7 cm apart. Draw the pair of direct tangent lines to the two circles. Use ruler and compass only and write also the steps of construction.

 [C.B.S.E., 1988 (A.I.)]
- 8. Construct a \triangle ABC with the vertical angle C=60°, base AB=5.4 cm and altitude through C=3.8 cm.
- Construct a △ABC having given that BC=5 cm, ∠A=60° and the median bisecting the base equal to 3.7 cm. Use the ruler and compass only.
- 10. Construct a quadrilateral ABCD in which AB=4.5 cm, BC=5.7 cm, CD=6 cm, DA=7.2 cm and BD=8 cm. On a line segment 5 cm long, construct another quadrilateral similar to the given quadrilateral.

STATISTICS

10.1. MEAN

A graph of data helps us to draw some conclusions about the data. The study of diagrams and graphs however depends much upon judgement and skill of drawing inferences. Sometimes it is helpful to inspect the data more closely for other worthwhile information e.g., representative number. One valuable bit of information is provided by the central tendency of the data.

All of us are well aware of 'average' which gives us the characteristic of a group and helps us in locating the central value. We speak of average rainfall, average temperature, batting average, etc., in daily life.

10.2. MEAN OF UNGROUPED DATA

Mean of ungrouped data is obtained by adding all the observations and dividing the sum by the total number of observations.

Mean =
$$\frac{x_1 + x_2 + x_3 + \dots + x_n}{n} = \frac{\sum_{i=1}^{n} x_i}{n}$$
,

where Σ (sigma) is used to denote the sum,

x; is a single score.

and n is the number of scores.

Mean is usually represented by M or \bar{x} .

Thus
$$\overline{x} = \frac{\sum_{i=1}^{n} x_i}{i=1}$$

n=8

Example 1. Find the mean weight of 8 men, having their weights in kilograms as under:

65, 75, 70, 63, 62, 73, 64, 68.

Solution. Here

Mean=
$$\frac{\sum_{\sum x_i}^n}{n}$$

 $\bar{x} = \frac{65+75+70+63+62+73+64+68}{8}$
 $= \frac{540}{8}$ = 67.5 kg

This single representative number 67.5 kg. is called the 'Average' or 'Arithmetic Mean' or simply 'Mean'.

This single number is capable of giving us the idea as to the weight of students in that class. So this is also called the central tendency of the group.

It should be noted that the unit of measurement in which the variable has been measured should be mentioned along with the value of the mean.

EXERCISE 10 (a)

(Section A)

1. The monthly income of six persons in a family is given below in rupees: 460, 1200, 1420, 240, 1060, 300.

Find the average monthly income in rupees.

2. The maximum temperature during seven days of the fourth week of May in New Delhi, were as:

30°C, 29°C, 31°C, 36°C, 37°C, 39°C, 41°C.

Calculate the mean maximum temperature for that week.

- 3. Find the mean weight of 8 men, having their weights in kilograms as under: 70, 64, 67, 75, 72, 66, 65, 77.
- 4. Heights of ten persons in centimetres are given below: 163, 156, 168, 158, 160, 164, 178, 167, 161, 170.

Find their mean height.

- 5. The arithmetic mean of 3, 7, 5, x, 8, -3 is 4. Find x.
- 6. The mean of the numbers 6, y, 7, x, 14 is 8. Express y in terms of x.

(Section B)

- 7. The mean of 5 numbers is 27. If one number is excluded, their mean is 25. Find the excluded number. [C.B.S.E., 1984 (Delhi)]
- 8. The mean height of 20 students is 155 cm. It is discovered later on that while calculating the mean, the reading 149 cm was wrongly read as 189 cm. Find the correct mean. [C.B.S.E., 1987 (A.I.)]
- 9. Duration of sun-shine (in hours) in Delhi for first ten days of August, 1984 as reported by Meteorological Department are given below:

(a) Calculate \overline{x} .

(b) Check that
$$\sum_{i=1}^{10} (x_1 - \overline{x}) = 0$$
.

[C.B.S.E., 1987 (A.I.)]

10'3. MEAN OF DISCRETE SERIES

Let us now learn how to find the mean of grouped data—discrete series.

If $x_1, x_2, x_3, \dots, x_n$ are the values of variables and $f_1, f_2, f_3, \dots, f_n$ are the corresponding frequencies, then

Mean =
$$\frac{f_1 x_1 + f_2 x_3 + f_2 x_3 + \dots + f_n x_n}{f_1 + f_2 + f_3 + \dots + f_n}$$

$$\bar{x} = \frac{\sum_{i=1}^{n} f_i x_i}{\sum_{i=1}^{n} f_i}$$

Thus

The following example will illustrate the method of calculation of the mean.

Example 2. Daily wages of 39 workers in a factory are given below:

Daily wages (in rupees)	Number of workers
7	4
8	7
10	11 .
11	8
14	6
15	3

Find their average daily wages.

Solution:

Daily wages (in rupees) x1	Number of workers	f_{iXi}
7	4	28
8	7	56
10	11	110
11	. 8	88
14	6	84
15	3	45
Total	39	411

 $\Sigma f_t = 39$

Here

$$\bar{x} = \frac{\sum_{i=1}^{n} \sum_{i=1}^{f_i x_i} \frac{411}{39}}{\sum_{i=1}^{f_i} \sum_{i=1}^{f_i} \frac{10.54}{39}}$$

... average daily wages=Rs. 10.54.

Remember the following steps for computation of mean:

 $\Sigma f_i x_i = 411$,

- (1) Multiply each value of the item (x_i) by its frequency (f_i) and write the product in the third column.
- (2) Find the sum of these products (fixi).
- (3) Find the sum of the frequencies.
- (4) Divide the sum of the products $(\Sigma f_i x_i)$ by the sum of the frequencies (Σf_i) .

EXERCISE 10 (b)

(Section A)

Compute the arithmetic mean of the following frequency table: 1.

Marks	Number of students
1	2
2	7
3	17
4	9
5	5

Following are marks (out of five) of 40 students: 2.

	(110) 01 10 3	radell12 .			
Marks	0	1	2	3	4	-
Number of students	6	2 .	10		4	5
7	· ·	J	10	10	. 8	3

Daily wages of 39 workers in a factory are given below: 3.

Daily wages (in rupees)	7	8	10	11	14	15
Number of workers	4	7	11	8	6	3

Find their average daily wages.

4. Find the mean age from the following data:

Age in years	Number of students
12	15
13	. 14
14 15	22
16	* 4
17	9
18	6
10	3

(Section B)

Compute the mean for marks obtained by 30 students in Mathematics in the Half-5.

The distribution of marks is given below:

	12 BIACH DEIOM :
Marks	Nines.
52	Number of students
58	7
	5
60	4
65	6
68	_
	3
70	3
75	2
1 2	2

6. The heights in contimetres of 60 students are given below:

Height	156	157	1 58	159	160	161	162	163
Number of students	4	9	10	14	18	7	5	3

Find their average height to the nearest cm.

7. The following table gives the basic salaries of persons employed in a factory:

6: -	
Salary in Rupees	Number of persons
110	5
130	7
150	·
170	10
190	. 15
	. 13
210	16
230	14

Calculate the mean basic salary.

10.3. MEAN OF CONTINUOUS SERIES

For a continuous series, mean is calculated with the formula given below:

$$\bar{x} = \frac{\sum_{i=1}^{n} f_i x_i}{\sum_{i=1}^{n} f_i}$$

where x_i is the mid-value of a class-interval and f_i is the frequency of that class. Remember the following steps for calculation of mean:

- (1) Find the mid value of each class-interval and write it in the third column.
- (2) Multiply each mid-value by the corresponding frequency.
- (3) Write these products in the fourth column and find their sum.
- (4) Divide this sum by the total of all the frequencies.

Example 3. Find the arithmetic mean for the following distribution:

Veekly wages (in rupees)	Number of workers
12.50—17.50	2
17.50—22.50	22
22.50—27.50	19
27.50—32.50	14
32.50-37.50	3

Solution:

Weekly wages in rupees	Number of workers f	x_i	fixi
12:50—17:50	2	15	30
17:50—22:50	22	20	440
22:50—27:50	19	25	475
27.50—32.50	14	30	420
32.50—37.50	3	35	105
Total	60	_	1470

Here
$$\Sigma f_i x_i = 1470$$
; $\Sigma f_i = 60$

$$\tilde{\kappa} = \frac{\sum_{i=1}^{n} f_i x_i}{\sum_{i=1}^{n} f_i} = \frac{1470}{60}$$
= 24.50

Hence average weekly wages=Rs. 24.50.

EXERCISE 10 (c)

(Section A)

1. Calculate the mean for the following table:

Age in years	Number of persons
0-10	4
10—20 20—30	8
30—40	12
40—50	32
10 00	14

2. Find the arithmetic mean from the frequency distribution given below:

Number of workers
1
8
10
5
4
2

3. The frequency-distribution of ages of some persons in an office is given below:

Age in years	Number of person
515	4
15—25	7
25—35	. 11
35—45	9
45—55	5
55—65	. 3

Find the mean of their ages.

(Section B)

4. Calculate the Arithmetic mean, correct to one decimal place, for the following frequency distribution of marks obtained in an Arithmetic Test:

Marks	0—10	10-20	20—30	3040	40—50
Number of student	2	5	20	8	7

5. Find the mean for the following distribution:

Class-interval	0-8	8—16	1624	24—32	32-40	40—48
Frequency	8	7	16	24	15	7

6. The ages of workers in a company are as follows:

Age (in years	i)				*	Number	of worke	rs
18—24							6	
2430							8	
30-36							12	
36-42							8	
42-48					•	8.	4	
4854		•	,	1	,	•	2	

Calculate the average age of the group.

[C.B S.E., 1986 (A.I.)]

7. In a study on certain disease, the following data were obtained:

Age at first detection (in years)	Number of patients
4—8	2
8—12	12
12-16	15
16-20	25
20-24	18
24—28	12
28—32	3
32-36	1
Find the average age at first detection.	[C.B.S.E., 1984 (A

10'4. SHORT-CUT METHOD FOR COMPUTING MEAN

When the frequencies and the values of the variable are quite large, a shorter method is used to save labour and time. We take an arbitrary mean. Then we find the deviations of the x-values from the arbitrary mean. The mean is calculated with the help of formulae given below:

For ungrouped data:

$$\overline{x} = A + \frac{\sum_{i=1}^{n} d_i}{n}$$

where

A=the assumed mean,

 $d_i = x_i - A =$ deviation of the item from A

and

n=number of items.

For discrete series:

$$\bar{x} = A + \frac{\sum_{i=1}^{n} f_i d_i}{\sum_{i=1}^{n} f_i}$$

where

A=the assumed mean,

 $d_i = x_i - A = deviation of the item from A$

fi=frequency of the item

For continuous series:

$$\widetilde{x} = A + \frac{\sum_{i=1}^{n} f_i d_i}{\sum_{i=1}^{n} f_i}$$

where

A=the assumed mean,

 $d_{i}=x_{i}-A$ =deviation of the mid-value from A

and

fe=frequency of that class.

Example 4. Heights of 10 children in cm in a Nursery class are 56, 67, 61, 68, 65, 60, 58, 65, 63, 64. Find the mean height.

Solution: Let the assumed mean (A) be 60.

Heights in cm	Deviation $dt = x_i - A$
56	-4
67	7
61	1
68	8
65	5
60	0
58	— 2
65	5
63	3
64	4
Total	27

Here

$$A = 60$$
 $\Sigma d_i = 27$ $n = 10$

$$\bar{x} = A + \frac{\sum_{d_i}^{n}}{n} = 60 + \frac{27}{10}$$

$$= 60 + 2.7 = 62.7$$

... Mean height=62.7 cm

Example 5. Find the Arithmetic Mean for the following distribution, giving the ages of 100 students of class IX in a public school in New Delhl.

Age in years	Number of students
11	8
12	27
13	33
14	20
15	12

Solution: Let the assumed mean (A) be 13.

Age in years	Number of students fi	Deviations $d_i = x_i - A$	fidi
11	8	-2	-16
12	27	-1	-27
13	33	0	0
14	20	1	20
15	12	2	24
Total	100	_	1

A=13,
$$\Sigma f_i d=1$$
, $\Sigma f_i = 100$

$$x = A + \frac{\sum_{i=1}^{n} f_{i}d_{i}}{\sum_{i=1}^{n} f_{i}} = 13 + \frac{1}{100}$$

$$=13+0.1$$
 $=13.01$

. Mean age=13'01 years

Example 6. Calculate the mean for the following distribution, giving the monthly incomes of 188 workers in a factory.

Income inrupees	Number of workers	Income in rupees	Number of workers
120—130	5	170—180	36
130—140	11	180—190	28
140—150	21	190—200	16
150—160	26	200—210	7
160—170	34	210—220	4

Solution: Let the assumed mean (A) be 175.

Income in rupees	Number of workers	Mid-value xi	Deviation $d_i = x_i - A$	feds
120—130	5	125	-50	-2 50
130—140	11	135	-40	-440
140—150	21	145	-30	-630
150—160	26	155	-20	-520
160—170	34	165	-10	-340
170—190	36	175	0	0
180—190	28	185	10	280
190—200	16	195	20	. 320
200—210	7	205	30	210
210—220	4	215	40	160
Total	188	_	_	-1210

A=175,
$$\Sigma f_i d_i = -1210$$
, $\Sigma f_i = 188$

$$x = A + \frac{\sum_{i=1}^{n} f_i d_i}{\sum_{i=1}^{n} 175 + \frac{-1210}{188}}$$

$$=175-6.44=168.56$$

Average monthly income=Rs 168.56.

EXERCISE 10 (d)

(Section A)

- 1. Find the mean of the following set of numbers 73, 71, 69, 67, 65, 63, 61, 59.
- Following are the weights (in kg) of ten newly born babies in a hospital on a particular day:
 3.4, 3.6, 4.2, 4.5, 3.9, 4.1, 3.8, 4.5, 4.4, 3.6.
- 3. Heights of 10 children in cm in a Nursery class are 56, 67, 61, 68, 65, 60, 58, 65, 63, 64, Find the mean height.
- 4. Calculate the arithmetic mean of the 15 numbers given as 19, 24, 23, 22, 24, 23, 21, 22, 20, 23, 21, 20, 22, 23.

(Section B)

5. Find the arithmetic mean of the following data:

Milk in litres	Number of cows
2	25
3	15
4	10
5 .	5
6	5

6. Find the arithmetic mean for the following distribution, giving the ages of 100 students of class IX in a school:

Age in years	11	12	13	14	15
Number of students	8	27	33	20	12

7. In an Intelligence Test conducted in a school, the marks out of 50 were as under:

Marks	19	20	30	35	40	
Number of students	5	2	18	3	5	

Find the mean score.

8. Find the mean age from the following data:

Age in years	12	13	14	15	16	17	18
Number of students	10	15	16	14	8	5	2

(Section C)

9.

Marks	0—20	2040	40-60	60-80	80—100
Number of students	6	12	22	7	3

For the distribution given above calculate the mean marks.

10. The data below gives the weekly earnings of 100 workers in a Flour Hill:

eekly earnings (in rupees)	Number of workers
0-50	8
50—100	15
100—150	32
150—200	26
200-250	12
250—300	7

[C.B.S.E., 1982 (Delhi)]

11. Calculate the mean for the following distribution:

0-5	5	20—25	25
5—10	8	25-30	15
10—15	15	30-35	8
15-20	21	35—40	6

[C.B.S.E., 1984 (Delhi)]

12. Calculate mean for the following table:

Income-tax in rupees	Number of persons paying	Income-tax in rupees	Number of persons paying
20-30	7	60-70	21
30—40	9	70-80	8
40—50	14	80—90	. 5
50—60	17	90—100	. 3

13. The heights of 100 school children in the same age group observed and classified as below:

Height in cm	Frequency	Height in cm	Frequency
135—140	2	155—160	23
140—145	4	160—165	14
145—150	19	165—170	6
150—155	31	170—175	1

Find their average height.

14. Find the arithmetic mean for the following distribution giving wages af 80 workers:

Wages in rupees	Number of persons	Wages in rupees	Number of persons
70—80	3	110-120	20
80—90	5	120—130	16
90—100	10	130—140	7
100—110	15	140—150	4

Find the arithmetic mean from the following table:

Weekly wages in Rs	Number of workers
Below 10	1
Below 20	9
Below 30	19
Below 40	24
Below 50	28
Below 60	30

Find the mean of the following: 16.

Marks	Number of Students
More than 60	0
More than 55	5
More than 50	11
More than 45	20
More than 40	40
More than 35	60
More than 30	70
More than 25	85
More than 20	90

10.5 MERITS AND DEMERITS OF MEAN

Merits:

- (1) It is uniquely defined i.e. it has one and only one value.
- (2) It is based on all observations.
- (3) It is easy to compute.
- (4) It is easily understood.

Demerits :

- (1) It is very much affected by the extreme values.
- (2) It cannot be computed if one of the observations of the data is missing.
- (3) It cannot be computed uniquely if the classes at the end are open.
- (4) It does not communicate all the information contained in the raw data. Consider a series of observations. Then study the effect of
 - (i) adding 'k' to every item,

- (ii) subtracting 'k' from every item,
- (iii) multiplying every item by 'k',
- (iv) dividing every item by 'k',

on the arithmetic mean of the series.

What do you observe?

The arithmetic mean of any number of items is increased or decreased by the quantity k, if each of the items is increased or decreased by the same quantity k.

The arithmetic mean of any number of items is multiplied or divided by the quantity k, if each of the items is multiplied or divided by the same quantity k.

10.6. MEDIAN

If all the values of a variable are arranged in ascending or descending order of their magnitude, then the value of the middle term is called **median**.

Median of a distribution is the value of the variable which divides it into two equal parts.

For Ungrouped Data:

The median of ungrouped data should be computed in the following steps:

- (i) Arrange the items in ascending or descending order of magnitude.
- (ii) Then value of the middle item is the required median.

Let n be the number of items.

If n is odd, the value of $\left(\frac{n+1}{2}\right)$ th item is taken as the median.

If n is even, we find the values of $(\frac{n}{2})$ th and $(\frac{n}{2}+1)$ th items. The average of these two values gives the median.

Example 7. The heights in centimetres of nine girls are 70, 59, 67, 61, 63, 64, 61, 72, 71

Find the median height.

Solution. The height (in centimetres) arranged in increasing order are 59, 61, 63, 64, 67, 70, 71, 72

Here the middle most value is 64 which is the median.

.. median height is 64 cm.

Example 8. Find the median of the following numbers:

5, 7, 9, 12, 10, 8, 7, 15, 21, 19, 25, 11, 15, 18.

Solution. Arranging these numbers in ascending order,

5, 7, 7, 8, 9, 10, 11, 12, 15, 15, 18, 19, 21, 25.

Here n=14, which is an even number.

So there are two central items i.e., $\left(\frac{14}{2}\right)$ th and $\left(\frac{14}{2}+1\right)$ th terms or 7th and 8th terms.

$$=\frac{11+12}{2}=\frac{23}{2}=11.5.$$

EXERCISE 10 (e)

(Section A)

- In a school examination it is decided that exactly half the pupils will pass. Name the 1. measures of central tendency that is used.
- A player makes the following scores in 8 matches: 2.

Find this median score.

Find the median for the set of numbers: 3.

Find the median of the following marks obtained by 16 students in a class-test marked out of 10 marks:

The daily earnings of 10 workers in a factory are 5.

Find the median earnings.

(Section B)

Find the median of the following observations:

If 92 is replaced by 99 and 41 by 43 in the above data, find the new median.

[C.B.S E., 1987 (A.I.)]

{1, 2, 3, 6, 8} is a set of five positive integers whose mean is 4 and median is 3. Write down two other sets of five positive integers, each having the same mean and

Like arithmetic mean, median too has some good properties:

- (1) It is easy to compute.
- (2) It is easily understood.
- (3) It is rigidly defined.
- (4) Unlike mean, it is not affected by the extreme values.

10.7. MORTALITY TABLES

Vital statistics deal with all the events of human life which have to do with an individual's entrance into or departure from life. So, vital statistics are numerical records of births, death, marriages, divorce separation, etc. In a broader sense vital statistics refer to all types of population statistics. For growth of population study of mortality factor is very important. Mortality rates help the health authorities in planning for sanitary improvements

Study the following table showing death rate in India during 1941-1986:

Davis J	-8
Period	Death rate per 1000
1941—1950	27.4
1951—1960	22.8
1961—1970	19:0
1971—1980	15.0
1981-1986	12:2
. 1 0	122

What inferences can you draw from the above table?

During 1941-1950, death rate was 27.4 which means that out of 1000 persons nearly 28 died due to various factors. After independence death rate came down due to increase of medical facilities and improvement in sanitary conditions. During 1971-1980, death rate came down to 15 per 1000. Note that death rate is a fluctuating measure. It can increase in a particular year due to natural calamity or epidemics.

10'8, INDEX NUMBER

The wages of factory workers are decided from time to time on the basis of the cost of living with the help of Index Numbers. Dearness allowance of Government employees is increased when consumer price index goes up. Index numbers are special types of weighted averages.

The index number is a widely used statistical device for comparing one group of related variables with another group of the same variables, for different periods of time, or places, between like categories. It is nothing but a representative number.

There are three types of index numbers which are commonly computed. They are

- (1) the price index numbers,
- (2) the quantity index numbers, and
- (3) the cost of living index numbers.

You know that a barometer is used to measure atmosphere pressure or pressure of gases. Similarly, index numbers are used to measure the pressure of economic behaviour. Therefore, index numbers are called 'economic barometers'.

The price index number is a numerical value that summarizes price levels.

Let us consider the following data:

Commodities	Prices in 1985	Prices in 1988
Wheat	Rs. 2.75 per kg	Rs. 3.50 per kg
Sugar	Rs. 5.25 per kg	Rs. 6.50 per kg
Tea	Rs. 25 per kg	Rs. 32 per kg
Butter	Rs. 48 per kg	Rs. 58 per kg
	Rs. 81	Rs. 90

We see that the total of the current prices for all commodities is Rs. 90 as against Rs. 81 in 1985 (base year).

 \therefore Prices in 1988 as compared with the prices in 1985 was $\frac{90}{81} \times 100$ i.e. 111.1 %

Thus, the price index of 1988 is 111 which means there is a net increase of 11% in the prices of commodities in the year 1988 as compared to 1985.

The whole sale price index numbers provide the information on general price levels in a country and the purchasing power of money.

The quantity index number is a measure of changing production or consumption.

Let us choose a middle-class working family in Delhi and find out monthly expenditure on certain items of consumption in 1985 and 1988.

Let us assume that there was no change in consumption pattern in that family.

Commodities	Quantity		1985		1988	
		Peter per ky in rupees	Expenditure in rupees	Price per kg in tupees	Expenditure in rupees	
Wheat	50 kg	2.75	137*50	3.20	175.00	
Sugar	10 kg	5.20	55.00	6.20	65.00	
Butter	3 kg	48:00	144.00	58.00	174.00	
Tea	1 kg	25.00	25.00	32.00	32.00	
Potatoes	30 kg	2 00	60.00	3.00	90.00	
Total	_	_	421.50		536.00	

We see that the middle-class working family had to spend Rs. 536 00 in 1988 as against Rs. 421'50 in 1985 to buy the same quantities of the same commodities.

Thus, the cost in 1988 as compared with cost in 1985 was $\frac{536}{421.5} \times 100$ i.e. 127.2%. We say that cost of living index was 127 in 1988 with 1985 as base year.

The cost of living index number is a price index with special reference to a class or category of people in a society at different times or in different regions.

The cost of living index numbers provide guidelines to the government for deciding policies relating prices, wages, rent control, taxation, etc.

These numbers are used in wage negotiations, D.A. adjustments and grant of bonus to workers, etc.

EXERCISE 10 (f)

(Section A)

- 1. Fill in the blanks correctly:
 - (a) In a broader sense vital statistics refer to all types of.....statistics.
 - (b) The population rates are calculated per.....persons.
 - (c) Index numbers are.....of economic activity.
 - (d) Usually an index number measures changes in a variable over a period of......
- What do you understand by Index Numbers?

(Section B)

Construct the index number for 1988 taking 1984 as the base year from the data given 3. C

4. Construct the cost of living index number for 1987 taking 1984 as base year, using the data about the monthly expenditure of a government employees family:

Items	Quantity	Prices per kg in 1984	Prices per kg in 1987
Wheat	20 kg	Rs. 2.50	Rs. 3
Rice	6 kg	Rs. 7	Rs. 6
Gram	5 kg	Rs. 1.60	Rs. 2'40
Pulses	8 kg	Rs. 5	Rs. 6
Ghee	2 kg	Rs. 25	Rs. 22
Sugar	10 kg	Rs. 3	Rs. 3
Huose Rent		Rs. 80	Rs. 100

REVIEW EXERCISE IX

(Section A)

- Fill in the blanks to make each of the following a true statement: 1.
 - (a) If the arithmetic mean of 6, 8, 5, 7, x and 4 is 7, then the value of x is...... [C.B.S.E., 1987 (Delhi)]
 - (b) The mean of the numbers 994, 996, 998, 1000, 1002 is.....

[C.B.S.E., 1986 (A.I)]

- (c) If the mean of the marks of five students is 33 and the mean of the marks of four of them is 32.5, the marks of the fifth students are..... [C.B S.E., 1986 (Delhi)]
- (d) The arithmetic mean of first ten natural numbers is...... [C.B.S.E., 1985 (A.I.)]
- (e) The arithmetic mean of the first five positive odd integers is......

[C.B.S.E., 1985 (A.I.)]

- (f) The mean of the first five natural numbers is...... [C.B.S.E., 1981 (Delhi)]
 - (g) The weight (in kg) of 5 men are 65, 62, 69, 66, 61. The median is........... [C.B.S.E., 1987 (A.I.)]

(Section B)

- 2. The mean of the five positive integers 3, 5, 8, 9 and x is 7. Find the value of x.
- 3. Find the mean of the following marks obtained by 16 students in a class-test marked

0, 0, 2, 2, 3, 3, 3, 4, 5, 5, 5, 5, 6, 6, 7, 8.

- The mean height of 15 students is 154 cm. It is discovered later on that while calculat-4. ing the mean the reading 175 cm was wrongly read as 145 cm. Find the correct mean height. [C.B.S.E., 1987 (Delhi)] 5.
- Duration of sunshine (in hours) in Amritsar for the first ten days of August, 1985

Calculate mean
$$(\bar{x})$$
 and show that $\sum_{i=1}^{10} (x_i - \bar{x}) = 0$

[C.B.S.E., 1986 (Delhi)]

- The average weight of a set of p articles is q grams and the total weight of another set of r articles is s kg. Calculate the average weight of (p+r) articles in kilograms.
- Compute the mean of the following data:

Height (in cm) 219 216 213 210 207	Frequency 2 4 6 10 11	Height (in cm) 204 201 198 195	Frequency 7 5 4 1
207	I1		[C,B,S.E., 1986 (Delhi)]

(Section C)

8. In a study on diabetic patients, the following data are obtained:

Age at detection (in years)	Number of cases
10—19	1
20-29	0
30—39	1
40—49	10
5059	17
60-69	38
70 – 79	ÿ
8089	3

Find the mean age at detection.

- 9. Compute the mean of the following frequency table by
 - (i) a direct-method and (ii) a short-cut method.

Class	Frequency
5—10	10
10—15	6
15-20	. 4
20—25	12
25—30	8
30—35 35—40	. 4
40-45	2
45—50	I .
43-30	3

10. Calculate the cost of living index number for 1971 on the basis of 1960 from the following data:

Item	Ye	Year 1971	
	Price/cost per unit	Quantity (Weight) in units	Price/cost per unit
Cereals	2.20	42.8	4.89
Other food articles	1.87	8:4	3.92
Clothing	3.68	7:5	5.24
Fuel and light	7.51	10.1	13.08
Rent	3.57	2.6	8.29
Education	5.29	3.9	7.96
Recreation	14.01	4:3	18.53
Miscellaneous	2.83	5.8	5.77

11. Calculate the mean of the following frequency distribution:

-	1
Income (in rupees)	Number of Workers
200-300	5
300-400	36
400-500	24
500-600	16
600-700	9
700-800	6
800-900	4

[C.B.S.E., 1981 (Delhi)]

12. The data below gives the earning of 350 workers in a cotton mill. Find the average monthly earning of the group.

Monthly earnings (in rupees)	Number of Works
160—180	40
180-200	54
200-220	60
220—240	72
240—260	45
260280	32
280-300	28
300320	15
320—340	4
	[C.B.S.E., 1985 (A.I.)]

11

TRIGONOMETRY

11'1. REVIEW

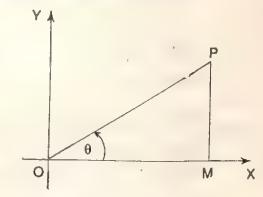

In class IX, you learnt about trigonometric ratios defined with the help of a right triangle. You will now learn more about concepts and results in trigonometry.

Let us review them.

$$\sin \theta = \frac{\text{perpendicular}}{\text{hypotenuse}} = \frac{\text{MP}}{\text{OP}},$$

$$\cos \theta = \frac{\text{base}}{\text{hypotenuse}} = \frac{\text{OM}}{\text{OP}}$$
,

$$\tan \theta = \frac{\text{perpendicular}}{\text{base}} = \frac{\text{MP}}{\text{OM}},$$

$$cosec \theta = \frac{hypotenuse}{perpendicular} = \frac{OP}{MP},$$

$$\sec \theta = \frac{\text{hypotenuse}}{\text{base}} = \frac{\text{OP}}{\text{OM}},$$

$$\cot \theta = \frac{\text{base}}{\text{cot }\theta = -\frac{\text{Constitute}}{\text{of }\theta}} = \frac{\text{OM}}{\text{NP}}$$

hypotenuse

TRIGONOMETRIC IDENTITIES

An equation in one or more variables is said to be an identity, if the equation is satisfied for all values of the variables involved.

In an identity, left hand side is equal for right hand side for all replacements of the variable(s) for which both sides are defined.

We shall now establish some basic trigonometric identities and use them to obtain some more simple identities.

Let the revolving line OP, starting from OX trace out $\angle XOP = \theta$, in the positive direction.

From P, draw PM LOX.

Now we get a right-triangle POM.

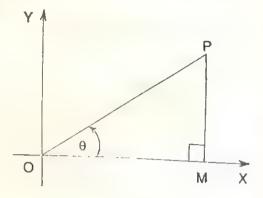

So, by Pythagoras theorem, we have MP²+OM²=OP²

(1) Dividing both sides by OP^2 , we get $\frac{MP^2}{OP^2} + \frac{OM^2}{OP^2} = \frac{OP^2}{OP^2}$

$$\Rightarrow \left(\frac{MP}{OP}\right)^2 + \left(\frac{OM}{OP}\right)^2 = 1$$

 $\Rightarrow (\sin \theta)^2 + (\cos \theta)^2 = 1$

$$\sin^2\theta + \cos^2\theta = 1$$

We observe that the equation is defined for $0^{\circ} < \theta < 90^{\circ}$. Since $\sin 0^{\circ} = 0$, $\cos 0^{\circ} = 1$, $\sin 90^{\circ} = 1$ and $\cos 90^{\circ} = 0$, this equation is satisfied, if we replace 0 by 0° or 90° .

So, the equation $\sin^2 \theta + \cos^2 \theta = 1$ is satisfied for all values of the variable θ . Hence $\sin^2 \theta + \cos^2 \theta = 1$ is an identity.

(2) Dividing both sides by OM2, we get

$$\frac{MP^2}{OM^2} + \frac{OM^2}{OM^2} = \frac{OP^2}{OM^2}$$

$$\Rightarrow \qquad \left(\frac{MP}{OM}\right)^2 + 1 = \left(\frac{OP}{OM}\right)^2$$

$$\Rightarrow \qquad (\tan \theta)^2 + 1 = (\sec \theta)^2$$

$$\therefore \qquad \tan^2 \theta + 1 = \sec^2 \theta$$

$$i.e., 1 + \tan^2 0 = \sec^2 0$$

(3) Dividing both sides by MP2, we get

$$\frac{MP^{2}}{MP^{2}} + \frac{OM^{2}}{MP^{2}} = \frac{OP^{2}}{MP^{2}}$$

$$\Rightarrow 1 + \left(\frac{OM}{MP}\right)^{2} = \left(\frac{OP}{MP}\right)^{2}$$

$$\Rightarrow 1 + (\cot \theta)^{2} = (\csc \theta)^{2}$$

$$\therefore 1 + \cot^{2} \theta = \csc^{2} \theta.$$

Thus, we have derived the following three fundamental identities:

$$\sin^2 \theta + \cos^2 \theta = 1$$

$$1 + \tan^2 \theta = \sec^2 \theta$$

$$1 + \cot^2 \theta = \csc^2 \theta$$

We can derive some more identities from these identities by simple applications of elementary algebraic operations like addition, subtraction, multiplication and factorization. Some examples are given below:

(i)
$$\sin^2 \theta = 1 - \cos^2 \theta$$

$$\sin^2 \theta = 1 - \cos^2 \theta$$

$$(ii) \qquad 1 + \tan^2 \theta = \sec^2 \theta$$

$$\sec^2 \theta - \tan^2 \theta = 1$$

$$\sec^2 \theta - \tan^2 \theta = 1$$

(iii)
$$\cot^2\theta = \csc^2\theta - 1 \qquad \cos^2\theta - \cot^2\theta = 1$$

Example 1. Prove the following identity
$$\cos\theta \csc\theta \cot\theta = 1$$
Solution. L.H.S. $=\cos\theta \csc\theta \tan\theta = 1$
Solution. L.H.S. $=\cos\theta \cdot \frac{1}{\sin\theta} \cdot \frac{\sin\theta}{\cos\theta}$ for $0^\circ < \theta < 90^\circ$

$$= \cos\theta \cdot \frac{1}{\sin\theta} \cdot \frac{\sin\theta}{\cos\theta}$$

$$= 1$$

$$= R.H.S.$$
Example 2. Prove that
$$\cos^4\theta - \sin^4\theta + 1 = 2\cos^2\theta, \text{ for } 0^\circ \leqslant \theta < 90^\circ.$$
Solution. L.H.S. $=\cos^4\theta - \sin^4\theta + 1$, for $0^\circ \leqslant \theta < 90^\circ$

$$= (\cos^2\theta)^3 - (\sin^2\theta)^3 + 1$$

$$= (\cos^2\theta + \sin^2\theta) (\cos^2\theta - \sin^2\theta) + 1$$

$$= (\cos^2\theta + \sin^2\theta) + 1$$

$$= \cos^3\theta - \sin^2\theta + 1$$

$$= \cos^3\theta - 1 + \cos^3\theta + 1$$

$$= \cos^2\theta - (1 - \cos^2\theta) + 1$$

$$= 2\cos^2\theta - (1 - \cos^2\theta) + 1$$

$$= 2\cos^2\theta - 1 + \cos^2\theta + 1$$

$$= 1\cos^2\theta - \cos^2\theta + \sin^2\theta + 1$$

$$= 1\cos^2\theta - \cos^2\theta + \sin^2\theta + \cos^2\theta + \cos^$$

(Section B)

 $\frac{1-\tan\theta}{1+\tan\theta} = \frac{\cot\theta-1}{\cot\theta+1}$

7. $\cot \theta + \tan \theta = \csc \theta \sec \theta$

8. $\sqrt{\csc^2 \theta - 1} = \cos \theta \csc \theta$ 9. $\tan^4 \theta + \tan^2 \theta = \sec^4 \theta - \sec^2 \theta$

 $\csc^4 \theta - \csc^2 \theta = \cot^4 \theta + \cot^2 \theta$

6.

10.

11.
$$\frac{1+\tan^2\theta}{1+\cot^2\theta} = \frac{\sin^2\theta}{\cos^2\theta}$$

12.
$$\frac{1}{\sec A + \tan A} = \sec A - \tan A$$

Hint:
$$\frac{1}{\sec A + \tan A} = \frac{1}{\sec A + \tan A} \times \frac{\sec A - \tan A}{\sec A - \tan A}$$
(Section C)

13.
$$\frac{\sec \theta + \tan \theta}{\sec \theta - \tan \theta} = 1 + 2 \tan \theta \sec \theta + 2 \tan^2 \theta$$

14.
$$\cos^4 A + \sin^4 A - 2 \sin^2 A \cos^2 A = (1 - 2 \sin^2 A)^2$$
 [C.B.S.E., 1982 (A.I.)]

15.
$$\sec^2 \theta \csc^2 \theta = \cot^2 \theta + \frac{1}{\cot^2 \theta} + 2$$

Example 4. Prove that
$$\sqrt{\frac{1+\sin\theta}{1-\sin\theta}} = \sec\theta + \tan\theta$$

[C.B.S.E., 1982 (A.I.)]

Solution. L.H.S. =
$$\sqrt{\frac{1+\sin\theta}{1-\sin\theta}}$$

= $\sqrt{\frac{1+\sin\theta}{1-\sin\theta}} \times \frac{1+\sin\theta}{1+\sin\theta}$

Multiply the numerator and denominator by the conjugate of the denominator.

$$= \sqrt{\frac{(1+\sin\theta)^2}{1-\sin^2\theta}}$$

$$= \sqrt{\frac{(1+\sin\theta)^2}{\cos^2\theta}}$$

$$= \frac{1+\sin\theta}{\cos\theta}$$

$$= \frac{1}{\cos\theta} + \frac{\sin\theta}{\cos\theta}$$

$$= \sec\theta + \tan\theta$$

$$= R.H.S.$$

Example 5. Prove that

$$\frac{\cos \theta}{1 - \tan \theta} + \frac{\sin \theta}{1 - \cot \theta} = \sin \theta + \cos \theta$$

Solution. L.H.S. =
$$\frac{\cos \theta}{1 - \tan \theta} + \frac{\sin \theta}{1 - \cot \theta}$$
=
$$\frac{\cos \theta}{1 - \frac{\sin \theta}{\cos \theta}} + \frac{\sin \theta}{1 - \frac{\cos \theta}{\sin \theta}}$$
=
$$\frac{\cos \theta}{\cos \theta - \sin \theta} + \frac{\sin \theta}{\sin \theta - \cos \theta}$$
=
$$\frac{\cos \theta}{\cos \theta - \sin \theta} + \frac{\sin^2 \theta}{\sin \theta - \cos \theta}$$
=
$$\frac{\cos^2 \theta}{\cos \theta - \sin \theta} + \frac{\sin^2 \theta}{\cos \theta - \sin \theta}$$
=
$$\frac{\cos^2 \theta - \sin^2 \theta}{\cos \theta - \sin \theta}$$

$$= \frac{(\cos \theta + \sin \theta) (\cos \theta - \sin \theta)}{\cos \theta - \sin \theta}$$

$$= \cos \theta + \sin \theta$$

$$= \sin \theta + \cos \theta$$

$$= R.H.S.$$

EXERCISE 11 (b)

Prove the following identities:

(Section A)

1.
$$\sqrt{\frac{1-\cos A}{1+\cos A}} = \frac{\sin A}{1+\cos A}$$
 [C.B.S.E., 1983 (A.I.)]
2. $\sqrt{\frac{1+\cos A}{1-\cos A}} = \csc A + \cot A$ [C.B.S.E., 1987 (A.I.)]

3.
$$\sqrt{\frac{1-\sin A}{1+\sin A}} = \sec A - \tan A$$

4.
$$\frac{1}{1 + \csc^2 \theta} + \frac{1}{1 + \sin^2 \theta} = 1$$

5.
$$(\sin \theta + \cos \theta) (\cot \theta + \tan \theta) = \sec \theta + \csc \theta$$

6.
$$(\tan \theta \csc \theta)^2 - (\sin \theta \sec \theta)^2 = 1$$

(Section B)

7.
$$\frac{2 \sin \theta \cos \theta - \cos \theta}{1 - \sin \theta + \sin^2 \theta - \cos^2 \theta} = \cot \theta$$

8.
$$(1-\sin\theta+\cos\theta)^2=2(1-\sin\theta)(1+\cos\theta)$$

9.
$$(\sin \theta + \csc \theta)^2 + (\cos \theta + \sec \theta)^2 = \tan^2 \theta + \cot^2 \theta + 7$$

(Section C)

10.
$$\frac{\csc \theta}{\csc \theta + 1} + \frac{\csc \theta}{\csc \theta - 1} = 2 \sec^2 \theta$$

11.
$$\frac{1}{\csc A - \cot A} - \frac{1}{\sin A} = \frac{1}{\sin A} - \frac{1}{\csc A + \cot A}$$

12.
$$\frac{\tan \theta}{\sec \theta + 1} + \frac{\tan \theta}{\sec \theta - 1} = 2 \csc \theta$$

13.
$$\frac{\tan A}{1-\cot A} + \frac{\cot A}{1-\tan A} = \sec A \csc A + 1$$

Example 6: Examine whether the equation

$$\cot \theta - \tan \theta = \frac{2 \cos^2 \theta + 1}{\sin \theta \cos \theta}$$

is an identity.

Solution. The variable θ in this equation can take values $0^{\circ} \leq \theta < 90^{\circ}$. Let us substitute $\theta = 45^{\circ}$ in both sides.

L.H.S.=cot
$$\theta$$
-tan θ =cot 45° -tan 45°
=1-1

R.H.S. =
$$\frac{2 \cos^2 0 + 1}{\sin \theta \cos \theta} = \frac{2 \cos^2 45^\circ + 1}{\sin 45^\circ \cos 45^\circ}$$

$$= \frac{2\left(\frac{1}{\sqrt{2}}\right)^{2} + 1}{\frac{1}{\sqrt{2}} \cdot \frac{1}{\sqrt{2}}} = \frac{2 \times \frac{1}{2} + 1}{\frac{1}{2}}$$
$$= \frac{2}{\frac{1}{2}} = 4$$

.. L.H.S. \neq R.H.S., when $\theta = 45^{\circ}$.

This proves that the given equation is not an identity.

Example 7. Solve the equation $\cot \theta + \tan \theta = 2 \csc \theta$

Solution. The variable θ in the equation can take such values as $0^{\circ} \le 0 \le 90^{\circ}$.

or
$$\frac{\cos \theta}{\sin \theta} + \frac{\sin \theta}{\cos \theta} = \frac{2}{\sin \theta}$$
or
$$\cos^2 \theta + \sin^2 \theta = 2 \cos \theta$$
or
$$1 = 2 \cos \theta$$
Then
$$\cos \theta = \frac{1}{2}$$

The given equation is satisfied for $0=60^{\circ}$.

Hence, the solution of the given equation is $\theta = 60^{\circ}$.

EXERCISE 11 (c)

(Section A)

Determine whether the following equations are identities:

1.
$$\sin^2 \theta + \sin \theta = 1$$

2.
$$\cot^2 \theta + \cos \theta = \sin^2 \theta$$

3.
$$\frac{1-\tan^2\theta}{\cot^2\theta+1}=2\tan^2\theta$$

4.
$$\frac{\tan \phi + \sin \phi}{\tan \phi - \sin \phi} = \frac{\sec \phi + 1}{\sec \phi - 1}$$

5.
$$\tan^4 \phi + \tan^6 \phi = \tan^8 \phi \sec^2 \phi$$

(Section B)

Solve the following equations:

6.
$$\frac{\cos \theta}{1 - \sin \theta} + \frac{\cos \theta}{1 + \sin \theta} = 4$$
7.
$$\tan^2 \theta + \cot^2 \theta = 2$$
8.
$$2 \sin^2 \theta - 5 \sin \theta + 2 = 0$$
9.
$$\tan^2 \theta - \sec \theta - 1 = 0$$

$$\cos^2 \theta - 3 \cos \theta + 2$$

10.
$$\frac{\cos^2 \theta - 3 \cos \theta + 2}{\sin^2 \theta} = 1$$

11.
$$\frac{\cos^2 \theta}{\cot^2 \theta - \cos^2 \theta} = 3$$

12.
$$\frac{\cos \theta}{\csc \theta + 1} + \frac{\cos \theta}{\csc \theta - 1} = 2.$$

11.3. TRIGONOMETRIC RATIOS OF COMPLEMENTARY ANGLES

Let ABC be a right triangle in which ∠ABC=90°.

Let $\angle BAC = \theta$. Then $\angle ACB = 90^{\circ} - \theta$

Here BC is the opposite side and AB is the adjacent side with respect to angle θ .

Then
$$\cos \theta = \frac{AB}{AC}$$
, for $0^{\circ} < \theta < 90^{\circ}$

AB is the opposite side and BC is the adjacent side with respect to angle $90^{\circ}-\theta$.

Then
$$\sin (90^{\circ} - \theta) = \frac{AB}{AC}$$
, for $0^{\circ} < \theta < 90^{\circ}$

So,
$$\sin (90^{\circ} - \theta) = \cos \theta$$
, for $0^{\circ} \leqslant \theta \leqslant 90^{\circ}$.

Observe that $\sin 0^{\circ} = 0 = \cos 90^{\circ}$ and $\sin 90^{\circ} = 1 = \cos 0^{\circ}$

Again,
$$\sin \theta = \frac{BC}{AC}$$
, for $0^{\circ} \leqslant \theta \leqslant 90^{\circ}$

and
$$\cos (90^{\circ} - \theta) = \frac{BC}{AC}$$
, for $0^{\circ} < \theta < 90^{\circ}$

So,
$$\cos (90^{\circ} - \theta) = \sin \theta$$
, for $0^{\circ} \leqslant \theta \leqslant 90^{\circ}$.

Observe that $\cos 0^{\circ} = 1 = \sin 90^{\circ}$ and $\cos 90^{\circ} = 0 = \sin 0^{\circ}$

Thus, cosine of an angle is the sine of the complementary angle and sine of an angle is the cosine of the complementary angle.

θ

In the same way, we can pair tangent with cotangent and secant with cosecant.

For
$$0^{\circ} \le \theta \le 90^{\circ}$$
, $\tan (90^{\circ} - \theta) = \frac{\sin (90^{\circ} - \theta)}{\cos (90^{\circ} - \theta)} = \frac{\cos \theta}{\sin \theta} = \cot \theta$

$$\therefore \quad \tan (90^{\circ} - \theta) = \cot \theta$$

Similarly,
$$\cot (90^{\circ} - \theta) = \frac{\cos (90^{\circ} - \theta)}{\sin (90^{\circ} - \theta)} = \frac{\sin \theta}{\cos \theta} = \tan \theta$$

$$cot (90^{\circ} - 0) = tan 0$$

For
$$0^{\circ} \leqslant \theta \leqslant 90^{\circ}$$
, sec $(90^{\circ} - \theta) = \frac{1}{\cos(90^{\circ} - \theta)} = \frac{1}{\sin \theta} = \csc \theta$

sec
$$(90^{\circ} - \theta) = \csc \theta$$

Similarly, cosec
$$(90^{\circ}-\theta)=\frac{1}{\sin (90^{\circ}-\theta)}=\frac{1}{\cos \theta}=\sec \theta$$

$$\cos \cos (90^{\circ} - \theta) = \sec \theta$$

Example 8. Show sin 60°=cos 30°, sec 30°=cosec 60° and tan 45°=cot 45°.

Solution.
$$\sin 60^{\circ} = \sin (90^{\circ} - 30^{\circ}) = \cos 30^{\circ}$$

 $\sec 30^{\circ} = \sec (90^{\circ} - 60^{\circ}) = \csc 60^{\circ}$
 $\tan 45^{\circ} = \tan (90^{\circ} - 45^{\circ}) = \cot 45^{\circ}$

Example 9. Find the value of

Solution.
$$\sin 20^{\circ} \sin 70^{\circ} - \cos 20^{\circ} \cos 70^{\circ}$$

 $= \sin 20^{\circ} \sin (90^{\circ} - 20^{\circ}) - \cos 20^{\circ} \cos (90^{\circ} - 20^{\circ})$
 $= \sin 20^{\circ} \cos 20^{\circ} - \cos 20^{\circ} \sin 20^{\circ}$
 $= \sin 20^{\circ} \cos 20^{\circ} - \sin 20^{\circ} \cos 20^{\circ}$
 $= 0$

EXERCISE 11 (d)

(Section A)

- 1. Express sin 81°+tan 81° in terms of angles between 0° and 45°.
- 2. Find the value of sin 40°-cos 50°.
- 3. Evaluate $\frac{\cos 59^{\circ}}{\sin 31^{\circ}}$.
- 4. Find the value of $\frac{\sin 55^{\circ} 44'}{\cos 34^{\circ} 16'}$.

(Section B)

- 5. Evaluate sin² 25°+sin² 65°.
- 6. Prove that $\sin \theta \cos (90^{\circ} 0) + \cos \theta \sin (90^{\circ} \theta) = 1$
- 7. Prove that $\cos 12^{\circ} \sin 78^{\circ} + \sin 12^{\circ} \cos 78^{\circ} = 1$
- 8. Prove that tan 9° tan 27° tan 45° tan 63° tan $81^{\circ}=1$

(Section C)

9. Find x from the equation

$$x \sin (90^{\circ} - \theta) \cot (90^{\circ} - \theta) = \cos (90^{\circ} - \theta)$$

- 10. Prove that $\sin (90^{\circ} A) \sin A \cot \Lambda 1 = -\sin^2 A$ [C.B.S.E, 1978 (A.I.)]
- 11. Prove that $\sin (90^{\circ} \theta) \cos (90^{\circ} \theta) = \frac{\tan \theta}{1 + \tan^{2} \theta}$ [C.B.S.E., 1980 (Delhi)]
- 12. Compare the areas of the right triangles ABC and DEF in which $\angle A=30^{\circ}$, $\angle B=90^{\circ}$, AC=4 cm, $\angle D=60^{\circ}$, $\angle E=90^{\circ}$ and DE=4 cm.

11.4. TRIGONOMETRIC TABLES

You already know the values of trigonometric ratios of certain angles e.g. 0°, 30°, 45°, 60° and 90°. But you need trigonometric ratios of different angles in different practical situations. Values of different trigonometric ratios have been computed correct to certain places of decimals. Tables of trigonometric ratios of such angles have been printed on pages to.

These tables have been given into two forms. Most of the values in the tables are approximate. For all practical purposes, these approximate values are taken as actually correct values.

A degree is subdivided into 60 equal parts. Each part is called a minute.

So, 1 degree=60 minute or 1°=60'

Table I gives the values, correct upto three or four places of decimals, of all the six trigonometric ratios for angles from 0° to 90° at intervals of 10 minutes. First and last columns have measures of angles. Between them are six columns headed by sin, cos, tan, cot, see and cosec and containing respective values.

Example 10. Find the value of sin 38°.

Solution: We look in the first column for 38° in the Table I. Then we see further in the row containing 38° till we find 0.6157 in the vertical column headed by sin.

$$\sin 38^{\circ} = 0.6157$$

Example 11. From Table I, find the value of tan 50° 20'.

Solution. We look in the first column for 50° 20'. We now move in the row containing 50° 20'. Then we move down in the column headed by tan At the intersection of these, we find the number 1'206.

 $tan 50^{\circ} 20' = 1.206$.

Table II gives the values of all the trigonometric ratios, at intervals of 0.1° i.e., 6' correct upto three or four places of decimals. The pattern of the table is similar to that of Table I in other respects.

Example 12. From Table II, find the value of see (42.6)°.

Solution. We look in the first column for 42.6° in the Table 11. Then we read the number in the row containing 42.6° and in the column headed by secant. There we locate the number 1.3585.

$$sec (42.6)^{\circ} = 1.3585$$

Example 13. Find the value of cot (67.4)°.

Solution. We locate the row which contains (67.4)° in the first column. The number in this row and in the column headed by cot is 0.4163.

 $\cot (67.4)^{\circ} = 0.4163$.

EXERCISE 11 (e)

(Section A)

Using trigonometric tables, find the values of the following:

1. sin 35°

2. cos 16°

3. tan 37°

1. sin 55°

5. cot 40°

6. sec 63°

7. tan 65° 20'

8. cos 31° 40'

9. cosec 24° 50'

10. tan (16.4)°

11. sec (51'4)°

12. sin (25'7)°

(Section B)

Use trigonometric tables to find;

13. $\sin 64^{\circ} 42' + \cos 42^{\circ} 20'$

14. tan 36° 40′ + cot 63° 20′

15. tan 47° 30′ + cosec 68° 20′.

Example 14. Find the length of the chord of a circle with radius 2 cm, subtending an angle of 100° at the centre of the circle. Give the answer correct to the first place of decimal.

Solution. Let O be the centre of the circle and AB be its given chord.

Then OA=OB=2 cm and ∠AOB=100°

Recall that a perpendicular from the centre of a circle to a given chord bisects the chord.

Draw OM LAB. Then M is the mid-point of AB.

△AOM≅△BOM (R.H.S.-Congruency Theorem)

 \therefore $\angle AOM = \angle BOM = \frac{1}{2} \times 100^{\circ}$ i.e. 50°

In the right-angle AOM,

 $\sin AOM = \frac{AM}{OA} \Rightarrow \sin 50^{\circ} = \frac{AM}{2}$

 $AM = 2 \times \sin 50^{\circ} = 2 \times 0.7660 = 1.5320 \text{ cm}$

So, the length of the chord AB=2AM

 $=2 \times 1.5320$ cm

=3.0640 cm i.e., 3.1 cm

Solution. If inscribed regular polygon has n sides, then each side subtends an angle θ at the centre,

where
$$\theta = \frac{360^{\circ}}{n}$$

Here $\theta = \left(\frac{360}{25}\right)^{\circ} = (14.4)^{\circ}$

Let AB be one of the sides of the inscribed regular polygon.

Join OA and OB, Draw OM 1 AB.

Now
$$OA = OB = 80 \text{ cm},$$

 $\angle AOB = \theta = (14.4)^{\circ}$

Also OM bisects the chord AB.

Then
$$AM = MB$$

And $\triangle AOM \cong \triangle BOM$

(R.H.S.—Congruency Theorem)

$$\angle AOM = \angle BOM$$

$$= \frac{\theta}{2} = (7.2)^{\circ}$$

In the right triangle AOM,

$$\sin AOM = \frac{AM}{OA} \Rightarrow \sin (7.2)^{\circ} = \frac{AM}{80}$$

..
$$AM = 80 \times \sin (7.2)^{\circ} = 80 \times 0.1253 = 10.024 \text{ cm}$$

So, $AB = 2 AM = 2 \times 10.024 \text{ cm} = 20.048 \text{ cm}$

Thus, the length of the side=20.05 cm, correct to the second decimal place.

EXERCISE 11 (f)

(Section A)

Find the length of the chord of a unit circle, subtending at the centre an angle of

- 1. 120° 2. 144° 3. 108°
- 4. Find the length of the chord of a circle with radius 2 cm, subtending an angle of 45° at the centre of the circle.
- 5. Find the length of the chord of a circle with radius 3 cm, subtending an angle of (14.6)° at the centre of the circle.

(Section B)

- 6. Find the length of a side of a regular polygon inscribed in a circle of radius one metre, if it has 100 sides. Give the answer in cm correct to the first decimal place.
- 7. Find the length of a side of a regular polygon of 24 sides inscribed in a circle of radius 75 cm, giving the answer correct to the first decimal place.
- 8. Find the area of an isoceles triangle with base 10 cm and vertical angle 57°.

(Section C)

- 9. Compare the lengths of chords of circles with radii 3 cm and 4 cm subtending angles 108° and 72° respectively at the corresponding centres.
- 10. Find the area of a right triangle with hypotenuse 6 cm and one of the acute angles 77°.

11.5. HEIGHTS AND DISTANCES

In the previous class you learnt how to solve simple problems on heights and distances using trigonometric ratios of special angles 30°, 45° and 60°. You will now solve similar problems involving different angles using trigonometric tables and logarithmic tables.

Example 16. A ladder is placed against a wall such that it just reaches the top of the wall. The foot of the ladder is 1'2 metres away from the wall and the ladder is inclined at an angle of 65° with the ground. Find the height of the wall correct upto two places of decimals.

Solution. Let AB represent the vertical height of the wall.

Let A and C be the positions of the top and bottom of the ladder, when AC represent the length of the ladder.

Let the height of the wall be h metres. Now AB=h metres, BC=1.2 metres,

$$\angle ACB = 65^{\circ}$$
 and $\angle ABC = 90^{\circ}$

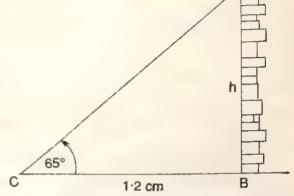

In the right triangle ABC,

$$\tan ACB = \frac{AB}{BC} \Rightarrow \tan 65^{\circ} = \frac{h}{1.2}$$

∴
$$h=1.2 \times \tan 65^{\circ}$$

= 1.2×2.145
= 2.574 metres

This, the height of the wall =2.574 metres i.e., 2.57 metres

Example 17. An otserver standing 72 metrcs away from a building notices that the angles of elevation of the top and the bottom of a flagstaff on the building are respectively 54° and 50°. Find the height of the flagstaff. [C.B.S.E., 1978 (A.I.)]

Solution. Let AB and BC represent the vertical heights of the flagstaff and the building respectively where A is the top and B is the bottom of the flagstaff.

Let O be the point of observation such that
$$\angle AOC=54^\circ$$
, $\angle BOC=50^\circ$ and

that
$$\angle AOC = 54^{\circ}$$
, $\angle BOC = 50^{\circ}$ and

$$OC=72 \text{ m}$$

Let the height of the building be h met-BC=h metres res. Then

In the right triangle BOC,

In the right triangle BOC;

$$\tan BOC = \frac{BC}{OC} \Rightarrow \tan 50^{\circ} = \frac{h}{72}$$

$$h = 72 \times \tan 50^{\circ} = 72 \times 1.192$$

Let the height of the flagstaff be x met-

res.

Then AB=x metres In the right triangle AOC,

In the right triangle AOC,

$$\frac{AC}{OC} \Rightarrow \tan 54^{\circ} = \frac{h+x}{72}$$

$$h + x = 72 \times \tan 54^{\circ}$$
= 72 × 1°376

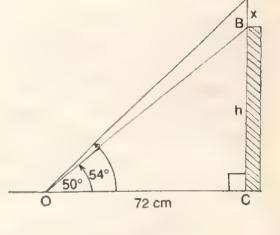

$$= 72 \times 1^{\circ}376$$
Then $x = 72 \times 1^{\circ}376 - h = 72 \times 1^{\circ}376 - 72 \times 1^{\circ}192$

$$= 72(1^{\circ}376 - 1^{\circ}192)$$

$$=72 \times 0.184$$

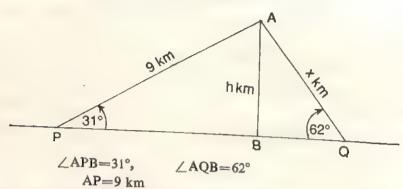

... the height of the flagstaff=13'25 metres

Example 18. The angles of elevation of the top of a hill at the city centres of two Example 18. The angles of clevation of the top of a nin at the city centres of two towns on either side of the hill are observed to be 31° and 62°. If the distance uphill from

the first city centre is 9 km, find in kilometres, the distance uphill from the other city centre, correct upto two places of decimals.

Solution: Let AB represent the vertical height of the hill. Let P and Q be the city centres on either side of AB such that

and

P and Q are to be taken on the same level ground. Let h km be the height of the hill.

$$\sin APB = \frac{AB}{AP} \Rightarrow \sin 31^{\circ} = \frac{h}{9}$$

$$h = 9 \sin 31^{\circ} = 9 \times 0.5150$$

Let the required distance uphill from the centre Q be x km. In the right triangle ABQ.

$$sin AQB = \frac{AB}{AQ} \Rightarrow sin 62^{\circ} = \frac{h}{x}$$

$$\Rightarrow 0.8829 = \frac{h}{x} \Rightarrow x = \frac{h}{0.8829}$$

$$x = \frac{9 \times 0.5150}{0.8829}$$
Then
$$x = \frac{9 \times 5150}{8829}$$

$$\therefore \log x = \log\left(\frac{9 \times 5150}{8829}\right)$$

$$= \log 9 + \log 5150 - \log 8829$$

$$= 0.9542 + 3.7118 - 3.9459$$

$$= 4.6660 - 3.9459$$
So,
$$\log x = 0.7201$$
This, gives
$$x = 5.249$$
Thus the required distance = 5.249 km

=5.25 kmcorrect upto two places of decimals.

EXERCISE 11 (g)

(Section A)

The angle of elevation of the top of a tower at a distance 40 metres from its foot on a 1. horizontal plane is found to be 57°. Find the height of the tower.

- 2. A glider is flying at an altitude of 792 m The angle of depression of the control tower of an airport from the glider is 18° 40′. Find the horizontal distance between the glider and control tower.
- 3. The string of a kite is 90 metres long and it makes an angle of 48° with the horizontal. Find the distance of the shadow of the kite from the holder.
- 4. Find the distance of the observer from the top of a cliff which is 132 metres high, given that angle of the elevation is 41°18'.
- 5. The upper part of a tree, broken by the wind in two parts, makes an angle of 31° with the ground. The top of the tree touches the ground at a distance of 9 metres from the foot of the tree. Find the height of the tree in metres correct upto 2 places of decimals.

(Section B)

- 6. Two masts are 15 metres and 10 metres high, and the line joining their tops makes an angle of 33°41' with the horizontal. Find their distance apart.
- 7. A person walking along a straight road observes that at two consecutive kilometre stones the angles of elevation of a hill in front of him are 30° and 75°. Find the height of the hill.
- 8. A vertical tower stands on a horizontal plane and is surmounted by a flagstaff of height 7 m. At a point on the plane, the angle of elevation of the bottom of the flagstaff is 36° and that of the top of the flagstaff is 45°. Find the height of the tower correct up to two places of decimal.
- 9. The angles of depression of two ships on either side of a light-house as observed from the top of the light-house are 52° and 41° 40′ respectively. If the height of light-house is 150 metres, find the distance between the two ships.
- 10. A fire at a building B is reported on telephone to two fire stations F₁ and F₂, 10 km apart from each other on a straight road. F₁ observes that the fire is at an angle of 50° to the road and F₂ observes that it is at an angle of 45° from it. Which station should send his team and how much will it have to travel?
- 11. A person, standing on the bank of a river observes that the angle subtended by a tree on the opposite bank is 64°, when he retires 40 metres from the bank, he finds the angle to be 35°. Find the height of the tree and the breadth of the river.

(Section C)

12. The tallest tower in a city is 100 m high and a multistoreyed hotel at city centre is 20 m high. The angle of elevation of the top of the tower at top of the hotel is 3° 36'. A building h metres high, is situated on the road connecting the tower with the city centre at a distance of 1 km from the tower. Find the value of h, if the top of the hotel, the top of the building and the top of the tower are in a straight line. Also find the distance of the tower from the city centre.

REVIEW EXERCISE X

(Section A)

- 1. Fill in the blanks to make the following statements true:
 - (a) Value of sin 55°-cos 35° is.....

[C.B.S.E., 1983 (A.I.)]

(b) $\frac{\cos 53^{\circ}}{\sin 37^{\circ}} = \cdots$

[C.B.S.E., 1983 (Delhi)]

(c) The value of $\sin \theta \sin (90^{\circ} - \theta) - \cos \theta \sin (90^{\circ} - \theta)$ is......

[C.B.S.E., 1982 (Delhi)]

- (d) The value of $\frac{\cos 20^{\circ} 35'}{\sin 69^{\circ} 25'}$ is......
- (e) The value of $\cos \theta \cos (90^{\circ} \theta) \sin \theta \sin (90^{\circ} \theta)$ is......

[C.B.S E., 1981 (A.I.)]

(f) The value of $\sin^2 20^\circ + \sin^2 70^\circ$ is.....

[C.B.S.E., 1979 (A.I.)]

2. Evaluate (a) $\frac{\sin 40^{\circ}}{\cos 50^{\circ}}$

(b) $\cos^2 17 - \sin^2 73^\circ$.

(Section B)

Prove the following identities:

3. $1-2\sin\theta\cos\theta=(\sin\theta-\cos\theta)^2$.

 $[C.B.S\ E.,\ 1983\ (A.I.)]$

4. $\frac{1}{1+\sin A} + \frac{1}{1-\sin A} = \frac{2}{\cos^2 A}$

[C.B.S.E, 1984 (A.I.)]

5. $\sqrt{\frac{1-\sin\theta}{1+\sin\theta}} = \frac{\cos\theta}{1+\sin\theta}$

[C.B.S.E., 1980 (Delhi)]

- 6. $-\frac{\sin (90^{\circ} A) \cos (90^{\circ} A)}{\tan A} = 1 \sin^2 A$
- 7. $\frac{1}{\cos \theta + \cos \theta} = \csc \theta \cot \theta$

[C.B.S.E., 1978 (A.I.)]

- 8. An electric pole is 10 m high. A steel wire tied to the top of the pole and affined at a point on the ground to keep the pole vertical, makes an angle of 49° with the horizontal line through the foot of the pole. Find the length of the steel wire.
- 9. Find the length of a side of a regular polygon inscribed in a circle of radius one metre, if it has 24 sides. Give the answer in cm correct to the first decimal place.

(Section C)

- 10. Prove that $\frac{\cos A}{1-\tan A} + \frac{\sin^2 A}{\sin A \cos A} = \sin A + \cos A$ [C.B.S E., 1983 (Delhi)]
- 11. Prove that $\frac{\tan^2 \theta}{\tan^2 \theta 1} + \frac{\cos^2 \theta}{\sin^2 \theta \cos^2 \theta} = \frac{1}{\sin^2 \theta \cos^2 \theta}$
- 12. A surveyer noted that the angle of elevation of a marker on top of a hill was 15° 20'. He walked 40 metres towards the foot of the hill along level ground and found the angle of elevation of the marker as 30° 30'. How far from surveyor's first position was the marker?

- 13. A vertical wall and a 40 metres high tower are in the same horizontal plane. From the top of the tower, the angles of depression of the top and bottom of the wall are 24° 30′ and 48° 20′ respectively. Find the height of the wall.
- 14. Prove that $\sin^6 \theta + \cos^6 \theta = 1 3 \sin^2 \theta \cos^2 \theta$

Hint.
$$(a+b)^3 = a^3 + b^3 + 3$$
 ab $(a+b)$
 $\Rightarrow a^3 + b^3 = (a+b)^3 - 3$ ab $(a+b)$

Now $\sin^6 \theta + \cos^6 \theta = (\sin^2 \theta + \cos^2 \theta)^3 - 3 \sin^2 \theta \cos^2 \theta (\sin^2 \theta + \cos^2 \theta)$

- 15. Prove that $2 (\sin^6 \theta + \cos^6 \theta) 3 (\sin^4 \theta + \cos^4 \theta) + 1 = 0$
- 16. Prove that $\frac{\tan A + \sec A 1}{\tan A \sec A + 1} = \frac{1 + \sin A}{\cos A}$

Hint, L.H.S. =
$$\frac{(\tan A + \sec A) - (\sec^2 A - \tan^2 A)}{\tan A - \sec A + 1}$$
$$= \frac{(\sec A + \tan A)(1 - \sec A + \tan A)}{\tan A - \sec A + 1}$$

COMPUTING-II

FLOWCHARTING

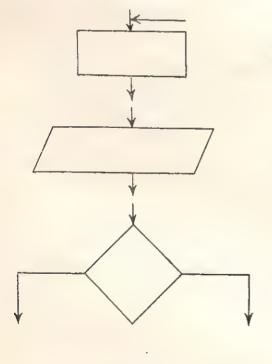

INTRODUCTION

You have already become familiar with the words 'computing' and 'computer'. As you know computer is an electronic machine that can store and process both numeric and non-numeric information and its important characteristics are (i) It carries out instructions most obediently: (ii) It does not get tired or bored by monotonous, lengthy and repetitive type of work and (iii) It works very fast.

One thing should be clear that computer cannot do any work on its own. Whenever we want the computer to solve a problem, we must provide it, in a suitable form, a method of solving that problem. In other words a computer has to be programmed for solving a particular problem. Before we proceed any further let us do quick revision of what we did last year.

Algorithm. A series of step-by-step instructions that leads to the solution of a problem is called an algorithm. Algorithm is thus a design or a plan of obtaining a solution to a problem. Computer science, computing science, Informatics, computing etc. are different names used to represent more or less the same body of knowledge. Algorithm is so much the central concept of this body of knowledge that some experts even use the name 'algorithmics for this subject.

Flowchart. A flowchart is a pictorial representation of the steps involved in the stepby-step procedure (algorithm). The standard symbols used in flowcharting are:

Rectangles used to describe all processing operations performed by a computer such as calculations or assignment.

Parallelograms used to indicate computer input or output,

Diamonds used to indicate a decision that will elicit a "Yes" or "No" answer.

Ovals used to denote beginning or end of a program.

Arrows used to indicate the direction of flow in the flowchart.

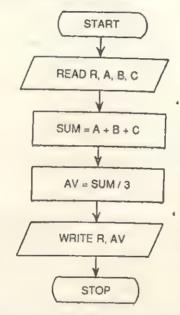

In your study of mathematics up till now you have solved many problems relating to profit and loss, ratio and proportion, simple and compound interest, average calculation etc. The methods of problem solving which you used for those problems can be nicely and accurately represented by listing the steps or by drawing a flow chart. The following examples will illustrate this.

Example 1. Suppose a boy has got his marks in 3 subjects. Calculates the average marks and outputs Roll no. and average marks.

Algorithm.

- Step 1. Read Roll No. and marks in 3 subjects and call them R, A, B and C respectively.
- Step 2. Add A, B, C and call it SUM.
- Step 3. Divide SUM by 3 and call it AV.
- Step 4. Write R and AV.
- Step 5. Stop.

The flowchart for the above procedure is as follows:

Now suppose we wish to find the average marks of all the students in the class. What do we do? Do we write the procedure as many times? This is hardly an efficient way.

Since all the steps have to be repeated for many students, we simply modify the above flowchart as shown on page 194.

Here we have introduced an arrow after the WRITE step which goes to the beginning. Following this arrow we can repeat the same steps many times. Each time the data in A, B and C will be different.

Suppose this procedure is to be followed for 3 students with following marks:

50, 62, 75 marks for first student.

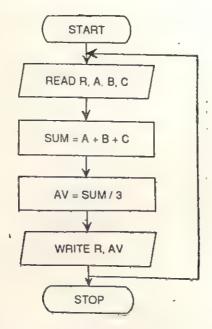

55, 80, 65 marks for second student.

75, 65, 70 marks for third student.

Let's do tracing of the flow chart with the above values.

When we come to READ box for the first time 50, 62, 75 will be stored in cells A, B, C. These values will be added and the result 187 will be stored in SUM. Average will be

calculated and printed. Now instead of stopping, the new arrow takes us back to the read box. This is called **looping**. New values are read and stored in locations A, B, C overwriting the previous values. New result taking the values 55, 80, 65 will be stored in SUM. With that the previous values are lost. The change in values of A, B, C, SUM and AV can be depicted as follows:

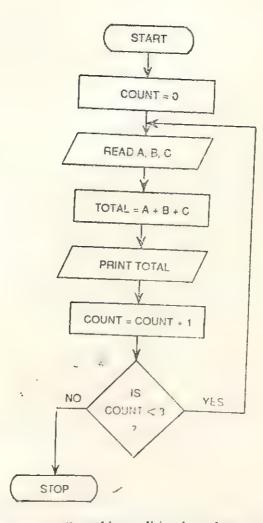

TRACING:

1		MEMOR	Y CELLS		
ITERATION	A	В	С	SUM	Av
1	50	62	75	187	62.33
2	55	80	65	200	66.66
3	75	65	70	210	70

In this way, by using the same memory locations and same step of procedures, we can do the processing for a number of students. In the above process the control moves back to box no. 2 even after processing is over for all the three students. Control never comes to stop box. Therefore flow chart has to be modified such that the control moves back only three times. Here comes the counting concept.

Consider the flow chart on page 195.

In this flowchart one more variable COUNT has been used. This is used for counting how many times the process is repeated. In the beginning COUNT is assigned starting value zero. Then all the processing steps follow. Before going back to the first step, COUNT is increased by one i.e., new value is stored in COUNT. Now COUNT=previous value of COUNT+1. In the beginning COUNT was equal to 0. So after processing for first student is than 3, the condition is true, so control moves back to step no. 3. The steps 3, 4, 5 and 6 are Again the condition is tested and control goes back to step 3. As soon as processing for all the three students is over i.e., the COUNT becomes equal to 3. The condition whether COUNT is

less than 3 or not is checked again. Since this condition is no longer true, the control is shifted to NO option and to STOP box. The processing comes to an end. Thus we are able to count the number of times the flowchart is performed and stop it at exactly the right point.

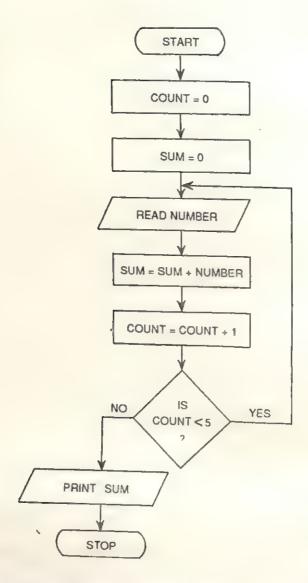

Example 3. Draw a flow chart for finding the sum of 5 given numbers.

Let us first work out its step-by-step procedure. Since we have to read numbers more than once we require to use the counter.

- Step 1. Set COUNT equal to zero. (Since we have not started counting.)
- Step 2. Set SUM equal to zero. (Since we have not started adding numbers.)
- Step 3. Read the number.
- Step 4. Add number to SUM and call it SUM.
- Step 5. Add 1 to COUNT and call it COUNT.
- Step 6. If COUNT < 5 then go to step 3 otherwise go to step 7.
- Step 7. Write SUM.
- Step 8. Stop.

In above algorithm we will keep on reading the numbers till all the 5 numbers are read i.e., COUNT=5. In step 7 the SUM is printed.

This can be represented in the flow chart form as given below:

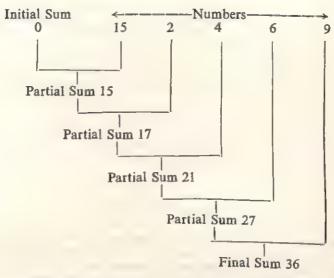

Now let us do tracing to see how the values change in the memory cells during processing. In this problem three memory cells are used. COUNT and SUM have starting value zero. Another variable NUMBER is used for holding the values.

Let's do tracing using 5 numbers: 15, 2, 4, 6, 9,

Number (Read Number)	Sum (Sum=Sum+Count)	Count	Condition Count < 5	Result Print Sum
15 2 4 6 9	0 0+15=15 15+2=17 17+4=21 21+6=27 27+9=36	0 0+1=1 1+1=2 2+1=3 3+1=4 4+1=5	Yes Yes Yes Yes	36

When the loop ends, the SUM cell in the memory has value 36 which gets displayed on the screen.

We find from tracing, SUM cell holds partial sum of numbers. Numbers are added one by one. They are held temporarily as partial sum till all the numbers are added. This can be explained as:

Let's take some more examples to clarify the concept of flow charts.

Example 4. Calculate the Net Salary of an employee if Basic Pay, House Rent Allowance (HRA), Dearness Allowance (DA), Travelling Allowance (TA) and Provident Fund are given.

In this particular problem we have to calculate the net salary of one employee. We know the Basic Salary, House Rent Allowance, Travelling Allowance, Dearness Allowance and Provident Fund. We also know that H.R.A., T.A. and D.A. have to be added to the Basic Pay to get the Gross Salary. Provident Fund has to be deducted from Gross Salary to get the Net Salary of the employee. Now let's set the variables; BP will stand for Basic Pay, HRA for House Rent Allowance, TA for Travelling Allowance and PF for Provident Fund. So Net Salary (NS) will be calculated using the following formula:

NS = BP + HRA + DA + TA - PF

Short Names for Memory Cells

BP, HRA: Basic Pay, House Rent Allowance

DA. TA: Dearness Allowance, Travelling Allowance

PF: Provident Fund

NS: Net Salary

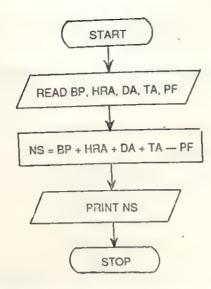

Step-by-step Procedure

Step 1. Read the values of BP, HRA, DA, TA and PF.

Step 2. Calculate wage using the formula NS=BP+HRA+DA+TA-PF

Step 3. Print NS.

Step 4. Stop.

Suppose we want to modify the above flow chart to have the possibility of calculating the wage of any employee. For this we want other details of employees like employee no., employee name etc., which can also be displayed along with the wage of that employee. Now we would like to introduce the loop and loop check. We want to repeat the same module to calculate the pay as many times as required and stop the loop using some check to see if salary of all the employees has been calculated. In other words if there are still more employees we should continue with the loop, otherwise we should come to stop.

Short Names for Memory Cells

EMP NO.: Employee number EMP NAME: Employee name

Other variable names are same as in the previous example.

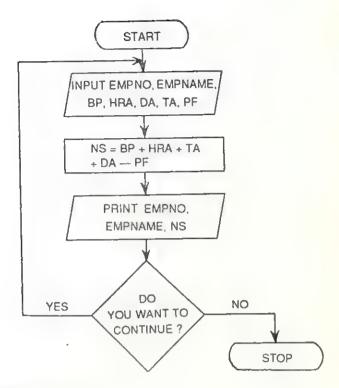

Step-by-step Procedure

- Step 1. Input the values of EMP NO., EMP NAME, BP, HRA, DA, TA, PF.
- Step 2. Calculate net salary using formula NS-BP+HRA+TA+DA-PF.
- Step 3. Print EMP NO., EMP NAME and NS.
- Step 4. Check if there are any more employees.
- Step 5. If Yes go to step 1 else go to step 6.
- Step 6. Stop.

The flow chart for the above example is given on page 199.

Example 5. To find out the average of physics marks of students in a given class. In this example we will follow the same procedure as we do in Algebra.

Suppose there are 10 students in the class and we want to calculate the average of their physics marks. We simply add the ten marks and divide the sum by 10. Here we know that total students in the class are 10. However their number can vary. So we should know how many students are there. Let us call the number of students as NS. We can read the physics marks of each student one by one until the number of students matches with NS. We can also keep on adding the physics marks in the SUM. Once we come out of the loop, we can divide the SUM by NS to get the average.

Short Names for Memory Cells

NS: Number of students

PM: Physics marks of any one student

SUM: Partial sum

COUNT: Counter for students

AVII: Average physics marks.

Step-by-step Procedure

Step 1. Input NS: the number of students in the class.

Step 2. Initialize the value of SUM as 0.

Step 3. Initialize the value of COUNT as 0.

Step 4. Input the value of PM: Physics marks of next student.

Step 5. Add PM to SUM and call it SUM.

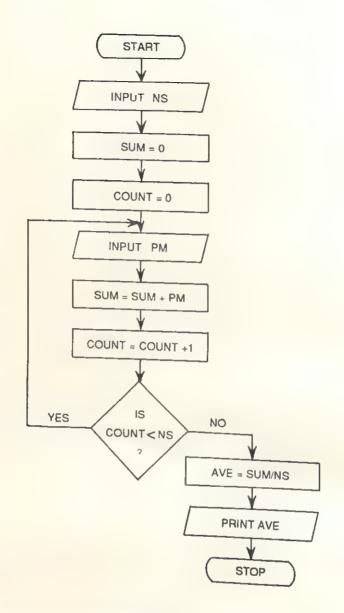

Step 6. Add 1 to COUNT and call it COUNT.

Step 7. If COUNT is less than NS then go to step 4 else go to step 8.

Step 8. Divide SUM by NS to give AVE.

Step 9. Write AVE.

Step 10. Stop.

The above flow chart can be divided into three parts: Initialization, processing and printing of result. The first four boxes constitute the initialization part. Here the initial values of different names such as NS, SUM and COUNT are set. Boxes 5 to 8 constitute the processing part. Here there is one loop consisting of steps 4 to 7. In this loop, we read the physics marks of each student, calculate the running sum, keep track of number of students processed so far and test to see if marks of all students have been processed. In box 9, we many flow charts can be seen as consisting of these parts.

Example 6. To calculate simple interest of 25 customers, where Principal, Rate of Interest and Time Period are given to you.

To calculate simple interest, we need to know the values of principal, rate of interest and time period. We should have 25 sets of these values because these values will vary from

customer to customer. We can not give all the values together. We will take one set at a time, calculate interest using the formula, I=P*R*T/100 and print the value of interest. We repeat this loop 25 times. For this we should have counter and counter check. The procedure will be like this:

Short Names for Memory Cells

P: Principal

R: Rate of interest

T: Time period

INT: Interest to be calculated

COUNT: For counting the number of customers

Step-by-step Procedure

Step 1. Initialize COUNT as zero.

Step 2. Input the values of Principal, Rate of interest and Time period.

Step 3. Calculate Interest using the formula INT=P*R*T/100.

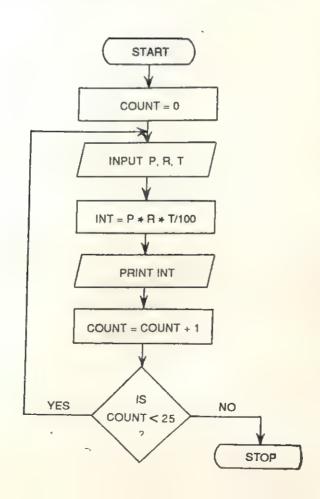

Step 4. Print INT.

Step 5. Add 1 to COUNT and store the new value in COUNT again.

Step 6. If COUNT<25 then go to step 2 else go to step 7.

Step 7. Stop.

Flow Chart

Example 7: Sudhir deposited Rs. 20,000 in his Savings Bank Account three years ago. Rate of interest is 12% per annum and is to be compounded monthly. Print table of the current amount in Sudhir's account each month for three years.

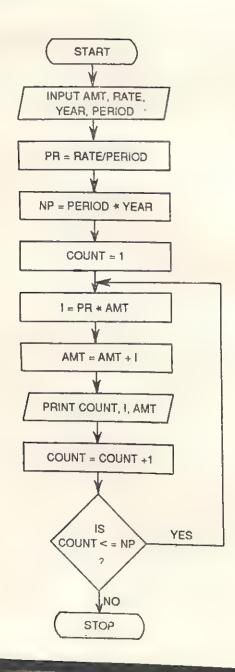

Short Names for Memory Cells

RATE : Rate of interest

AMT : Amount
T : Time period
I : Interest
COUNT : Counter

PR : Period rate

Flow Chart

The flowchart given on page 202 is based on the following algorithm:

Algorithm

Step 1. Input the AMOUNT, RATE, no. of periods per year.

Step 2. Divide RATE by periods per year and call it PR (period rate).

Step 3. Multiply periods per year with number of years and call it NP (number of periods).

Step 4. Initialize the counter to 1.

Step 5. Multiply AMT by PR and call it I. Step 6. Add I to AMT and call it AMT.

Step 7. Write COUNT, I, AMT.

Step 8. Add I to COUNT and call it COUNT.

Step 9. If COUNT is less than or equal to the number of periods (NP) then go to Step 5 otherwise go to Step 10.

Step 10. Stop.

Example 8. Calculate the HCF (Highest Common Factor) for two given numbers.

Suppose two numbers are 27 and 45. Compare the two numbers and treat the bigger of the two numbers as numerator and the other number as denominator. In this case 27 is denominator and 45 is numerator.

Step 1. Divide numerator by denominator.

Step 2. Divide the divisor of Step 1 by the remainder in Step 1.

Step 3. Repeat Step 2 with new values of divisor and remainder obtained in Step 2 until remainder becomes zero.

The last divisor is highest common factor. ... HCF of 27 and 45 is 9. In Step 1 divide numerator by denominator and find the remainder. If the remainder is equal to zero then denominator is the answer otherwise make your denominator the numerator and remainder the denominator and again repeat the process till you have remainder equal to zero.

In above example, in Step 3 the remainder comes to be zero. So, the denominator i.e., 9 is the HCF of 27 and 45.

Now let us develop an algorithm for the above problem.

Algorithm. To find HCF of two given numbers A and B.

Step 1. Read two numbers and call them A and B.

Step 2. Compare A and B. If B>A then go to Step 5 otherwise go to Step 3.

Step 3. Call B, denominator (D) and call A, numerator (N).

Step 4. Goto Step 6.

Step 5. Call A, the denominator (D) and call B, numerator (N).

Step 6. Divide N by D.

Step 7. Check if remainder (R)=0 then go to Step 11 otherwise go to Step 8.

Step 8. Call denominator (D) as numerator (N).

Step 9. Call remainder (R) as D.

Step 10. Go back to Step 6.

Step 11. Write "Highest Common Factor is" D.

Step 12. Stop.

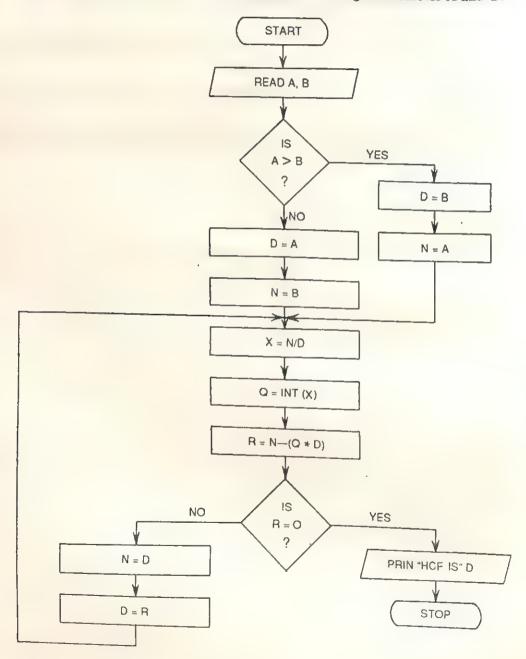

Before we convert this algorithm into flow-chart Step 7 requires further expansion. The problem is how to calculate the remainder.

Step (a) divide N by D and call it X (Quotient).

Step (b) take integer value of X [there is INT function available] and call it Q.

Step (c) Subtract (Q * D) from N and call it R.

Now we can draw the flow-chart for finding HCF of 2 given numbers A and B.

Let's do tracing of the above flow chart taking the two numbers as 27 and 45.

Tracing

A	В	D	N	X	Q=INT(X)	R = N - (Q * D)	Result
27	45	27	45	1.6	1	18	
		18	27	1.5	1	9	
		9	18	2	2	0	9

Example 9. Calculate the LCM of two given numbers A and B.

HCF and multiply the quotient by the other number i.e.,

$$LCM = \frac{A}{HCF} * B$$

Algorithm:

Step 1. Read two numbers and call them A and B.

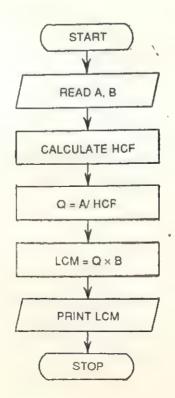

Step 2. Calculate their HCF (following the procedure given in previous example).

Step 3. Divide A by HCF and call it Quotient.

Step 4. Multiply Quotient by B and call it LCM.

Step 5. Write LCM.

Step 6. Stop.

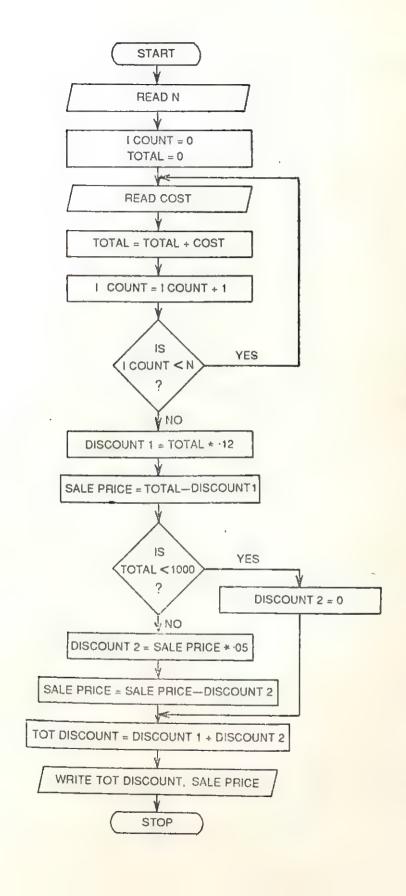

HDF is calculated following the same procedure as explained in the previous example.

Example 10. A person buys a number of goods from a departmental store in a sale. The departmental store is offering discount of 12% on each item. Additional discount of 5% is given if the person has made purchases in excess of Rs. 1000/-. Input consists of number of items purchased and cost price of each item. Calculate the discount and sale price.

Algorithm

- Step 1. Read the number of items purchased and call it N.
- Step 2. Initialize the item counter (I COUNT) as zero.
- Step 3. Initialize TOTAL as zero.
- Step 4. Read the cost of item and call it COST.
- Step 5. Add COST to TOTAL and call it TOTAL.
- Step 6. Add 1 to I COUNT and call it I COUNT.
- Step 7. If I COUNT < N then go to Step 4.
- Step 8. Multiply TOTAL by '12 and call it DISCOUNT 1.
- Step 9. Subtract DISCOUNT 1 from TOTAL and call it SALE PRICE.
- Step 10. If TOTAL is < 1000 then DISCOUNT 2=0 and go to step 13 otherwise go to Step 11.
- Step 11. Multiply SALE PRICE by '05 and call it DISCOUNT 2.
- Step 12. Subtract DISCOUNT 2 from SALE PRICE and call it SALE PRICE.
- Step 13. Add DISCOUNT 1 and DISCOUNT 2 and call it TOT DISCOUNT.
- Step 14. Write TOTAL, TOT DISCOUNT, SALE PRICE.
- Step 15. Stop.

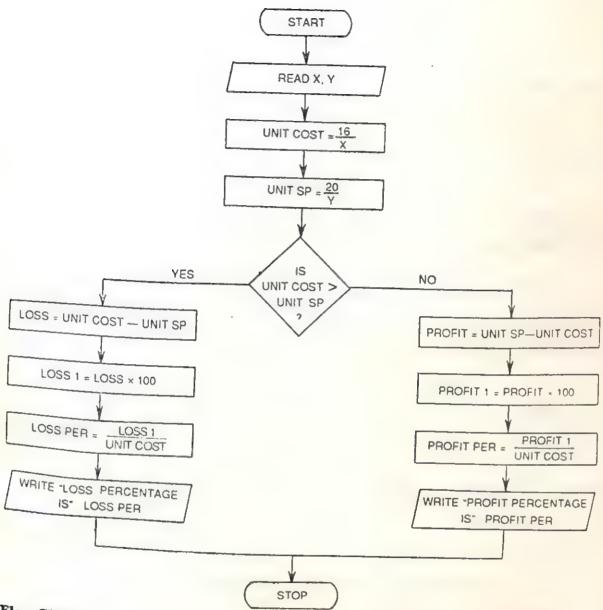

Example 11. A boy buys oranges at X oranges for Rs. 16 and sells them at Y oranges for Rs. 20. Find his gain or loss percent.

Algorithm

- Step 1. Read values of X and Y.
- Step 2. Divide 16 by X and call it UNIT COST.
- Step 3. Divide 20 by Y and call it UNIT SP.
- Step 4. If UNIT COST > UNIT SP go to Step 9.
- Step 5. Subtract UNIT COST from UNIT SP and call it PROFIT.
- Step 6. Multiply PROFIT by 100 and call it PROFIT 1.
- Step 7. Divide PROFIT 1 by UNIT COST and call it PROFIT PER.
- Step 8. Write "PROFIT PERCENTAGE IS", PROFIT PER.
- Step 9. Go to step 13.
- Step 10. Subtract UNIT SP from UNIT COST and call it LOSS.
- Step 11. Multiply LOSS by 100 and call it LOSS 1.
- Step 12. Divide LOSS 1 by UNIT COST and call it LOSS PER.
- Step 13. Write "LOSS PERCENTAGE IS", LOSS PER.
- Step 14. Stop.

The flow chart for the above example is given on page no. 209.

Flow Chart

Example 12. Prepare an algorithm to find the deviation from the average marks (posimarks obtained.

Solution. Before proceeding to develop an algorithm for the above problem let us understand the terms clearly. A candidate is considered above average (positive deviation) if his marks are more than the average marks and is considered below average (negative deviation) if his marks are less than the average marks. If his marks are equal to average marks he is considered to be average (no deviation). Various formulas which we shall be using are:

ABOVE=MARKS—AV BELOW=AV—MARKS

ABOVE
$$\% = \frac{ABOVE}{AV} * 100$$
BELOW $\% = \frac{BELOW}{AV} * 100$

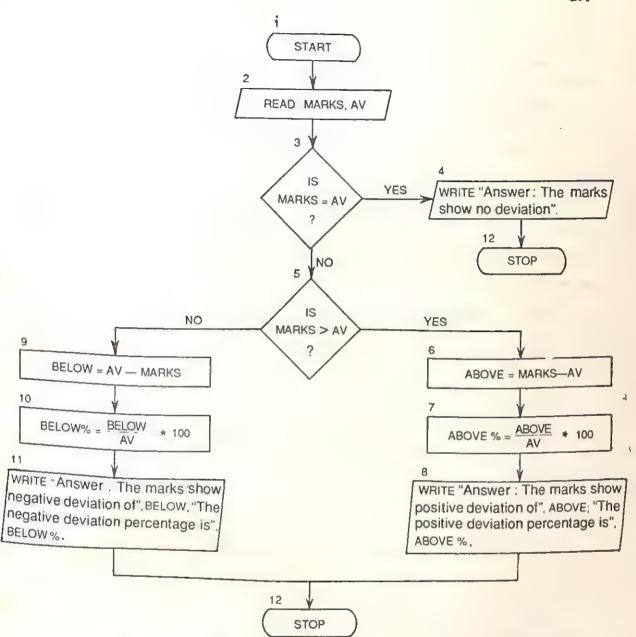

where terms have obvious meanings.

Now we proceed to develop an algorithm for the above problem.

- Step 1. Read the values of MARKS and AV.
- Step 2. If MARKS=AV then go to step 8.
- Step 3. If MARKS>AV then go to step 10.
- Step 4. Subtract MARKS from AV and call it BELOW.
- Step 5. Calculate BELOW %= BELOW * 100.
- Step 6. Write "Answer: The marks show negative deviation of", BELOW; "The negative deviation percentage is", BELOW %.
- Step 7. Go to step 13.
- Step 8. Write "Answer: The marks show no deviation".
- Step 9. Go to step 13.
- Step 10. Subtract AV from MARKS and call it ABOVE.
- Step 11. Calculate ABOVE $\% = \frac{ABOVE}{AV} * 100$.
- Step 12. Write "Answer: The marks show positive deviation of", ABOVE; "The positive deviation percentage is", ABOVE %.
- Step 13. Stop.

Note. When 'Write' instruction is executed, whatever is included in quote marks is outputed as it is.

Now let us represent the above algorithm in the form of a flowchart.

Let us execute the above flow chart taking 75 as the value of MARKS and 52 as the value of AV.

Execution beging at START box numbered 1. When we reach READ box the values of MARKS and AV are read. Now MARKS=75 and AV=52.

In box numbered 3 the values of MARKS and AV are compared. Since MARKS is not equal to AV we come to box numbered 5. Here again their values are compared. Since MARKS is greater than AV control takes us to box numbered 6.

Here value of ABOVE is calculated. ABOVE=75-52=23. Next we come to box numbered 7. Here we calculate ABOVE %. ABOVE $\% = \frac{23}{52} \times 100 = 44.23\%$.

of 23. Now we come to WRITE box. We write Answer: The marks show positive deviation The positive deviation percentage is 44°23%.

Now the control takes us to box numbered 12 and we stop.

Problem. If 8 men can reap 80 hectares in 24 days, how many hectares can 36 men reap in 30 days?

Solution. Before developing an algorithm for the above problem. Let us understand the procedure for solving it.

In 24 days, if 8 men can reap 80 hectares then 36 men can reap $36 \times \frac{80}{8} = 360$ hectares in 24 days.

Now if 36 men can reap 360 hectares in 24 days they can reap $360 \times \frac{30}{24} = 450$ hectares in 30 days.

Now let us develop an algorithm for the above problem.

Algorithm.

Step 1. Assign the values to variables:

$$M1=8$$
, $H1=80$, $DI=24$, $M2=36$, $D2=30$.

Step 2. Calculate H2 using the formula

$$H2 = \frac{M2 \times HI}{MI}$$
.

Step 3. Calculate H3 using the formula

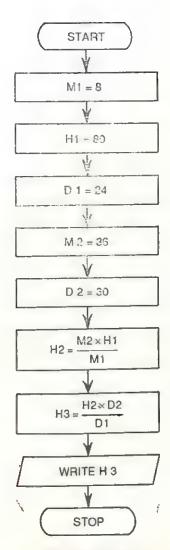

$$H3 = \frac{H2 \times D2}{D1}.$$

Step 4. Write H3.

Step 5. Stop.

Flowchart for the above problem is given on page 213,

Flow Chart

EXERCISE 12

- 1. The value of N factorial (N!) is equal to $n \times (n-1) \times (n-2) \dots 3 \times 2 \times 1$. Draw a flowchart to calculate and print the value of N! where N is a positive integer.
- 2. Make a flow chart to find the second largest number out of a given set of K numbers.
- 3. Draw a flow chart to find the sum of squares of first 15 numbers

 $i.e., 1^2+2^2+3^2+\dots 15^2.$

- 4. Draw a flow chart to print multiplication table of any number N. Write its step-by-step procedure also.
- 5. Draw a flow chart to compute and print grades for an examination. Input is roll no. and marks in five subjects out of 50. The grades are awarded as below:

Percentage of Marks	Grad
90 and above	'A'
80-89	'В'
7079	,С,
Less than 70	'D'

6. Income tax T (in Rupees) is calculated on the taxable income I (in Rupees) according to the following formulae:

If
$$0 \le I \le 15,000$$
 then $T=0$

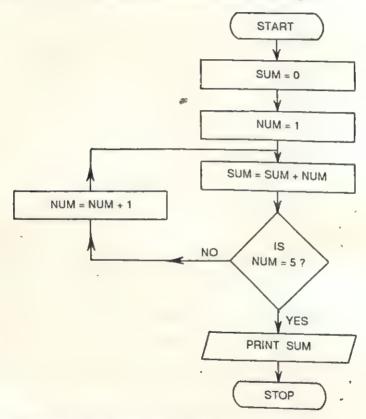

If
$$15,000 < I \le 22,000$$
 then $T=15\%$ of I in excess of $15,000$

If
$$22,000 < I < 45,000$$
 then $T=3000+25\%$ of I in excess of $22,000$.

If
$$45,000 < I$$
 then $T=8,000+40\%$ of I in excess of $45,000$.

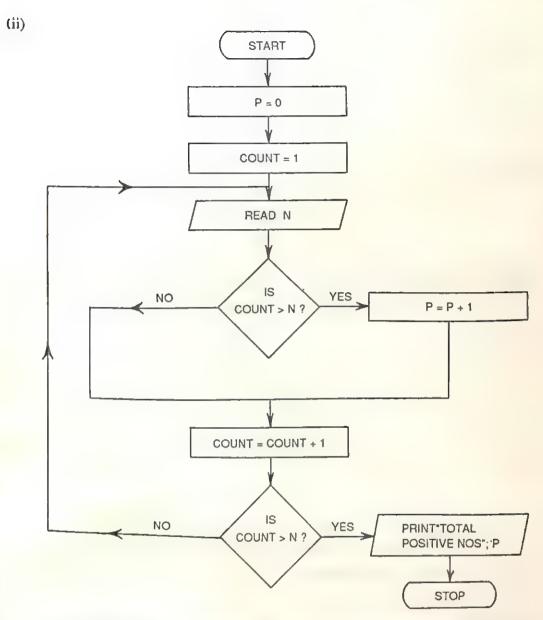

Write an algorithm to calculate the income tax payable by a person given his taxable income. Draw the corresponding flow chart also.

7. Do tracing for the following flow charts and show the output.

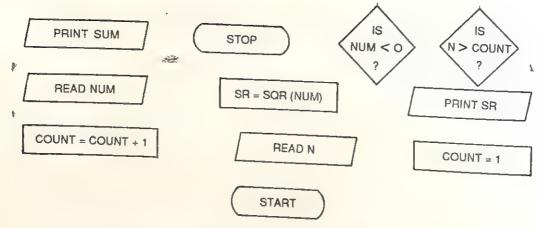

Also trace the above flow chart with following conditions:

- (i) NUM < 5
- (ii) NUM > 5
- (iii) NUM > = 5

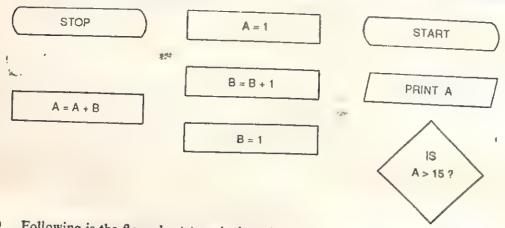

Do tracing for the above flow chart using following values and find the output: 5, 0, -62, 29, 54, 79, 48, -9, -8, 0, 59, 62

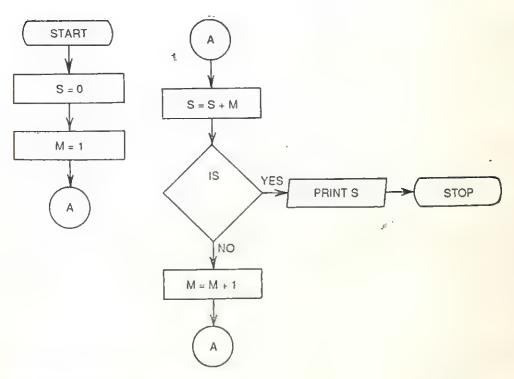

8. (i) Design a flow chart for finding square roots of a set of N numbers which contain few negative numbers also using the given instructions.

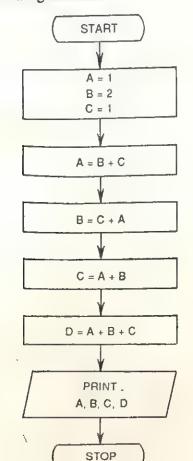

(ii) The following instructions given below, when placed in the correct order, would produce an output of 1, 3, 6, 10, 15. Design a flow chart using all instructions to

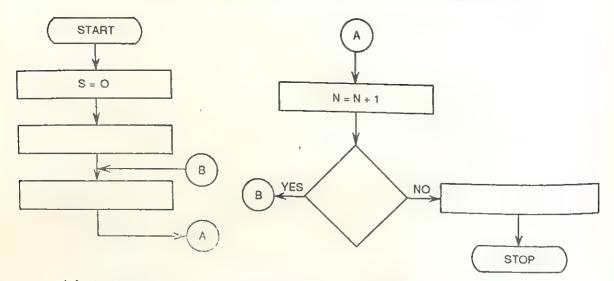

- Following is the flow chart to calculate the sum of series $1+2+3+\dots+n$ Write what will be the output if you use the following condition in the decision box;
 - (i) M > 10
 - (ii) M > 20
 - (iii) $\mathbf{M} = \mathbf{0}$
 - (iv) $M \geqslant 20$
 - (v) M ≤ 20
 - (vi) M < 20

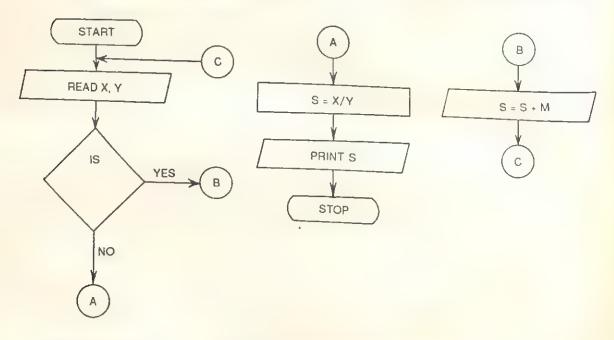

10. Give the outputs of the following flowchart.

- 11. Fill in the blanks in the following flow charts :
 - (i) A flow chart for calculating and printing the sum of first 100 numbers.

(ii) A flow chart to find the division of X by Y is given below. Give proper check whether Y is equal to zero or not.

Extend the above flow chart to find the quotient and remainder of X/Y.

- 12. Draw a flow chart for finding the greatest number that will divide 2930 and 3250 and
- 13. Draw a flow chart for finding the L.C.M. of 364, 2520 and 5265.

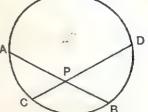

- 14. A house is sold for Rs 1230 at a loss of 18%. What would have been the loss or gain per cent had it been sold for Rs 1600? Write the algorithm and draw the flowchart for solving the above problem.
- 15. A man purchases a certain number of toffees at 25 a rupee and the same number at 20 a rupee. He mixes them together and sells them at 45 for 2 rupees. Find his gain or loss per cent on the entire transaction. Write the step-by-step procedure for solving the above problem.
- 16. What sum of money will produce Rs 143 interest in 3½ years at 2½ p.c. simple interest? Draw a flowchart for the above problem.
- 17. Find the amount at compound interest on Rs. 2700 in 3 years at 3\frac{1}{3} per cent p.a. Write the algorithm for solving the above problem.
- 18. If 30 men working 7 hours a day can do a piece of work in 18 days, in how many days will 21 men working 8 hours a day do the same piece of work? Write the algorithm and draw the flow chart for above problem.
- 19. How many horses would be required to plough 117 hectares of land in 35 days, if 10 horses can plough 13 hectares in 7 days? Draw the flow chart for the above problem.
- 20. In finding the H.C.F. of two numbers the last divisor is 49 and the quotients 17, 3, 2. Find the numbers. Draw a flow chart for the solution to the above problem.
- 21. Draw the flow chart for finding the smallest prime number greater than 47.
- 22. Draw a flow chart for finding the cost price of an item given its selling price and percentage gain or loss incurred.
- 23. At what rate per cent simple interest will a sum of money treble itself in 25 years? Write the algorithm for the above problem.

TEST PAPERS

TEST PAPER 1

(Time Allowed: 3 hours)

- 1. Fill in the blanks to make each of the following a true statement:
 - (a) Value of sin 20° sin 70°—cos 20° cos 70° is.......
 - (b) In the figure, chords AB and CD intersect inside the circle at P. If AP=6 cm, BP=4 cm, PD=8 cm, then CP=.....
 - (c) If P, Q, R are three points on a circle with centre O and ∠PQR=57°, then ∠POR=......
 - (d) The mean of 3, 5, 7, 9 and 11 is.......
 - (e) A real number a is said to be a zero of a polynomial P(x), if......

- 2. (a) Find the sum and the product of the roots of the equation $x^2 \sqrt{3} = 0$.
 - (b) Is $\sqrt{100 + \sqrt{36}}$ the same as $\sqrt{100 + 36}$? Give reasons.
 - (c) What is a system of linear equations having no solution called?
 - (d) Find the g.c.d. of (2x-7)(3x+4) and $(2x-7)^2(x+3)$.
 - (e) Factorise x^2-x-12 .
- 3. (a) Prove that $\frac{1}{1+\sin A} + \frac{1}{1-\sin A} = \frac{2}{\cos^2 A}$
 - (b) In a circle of 6 cm radius, find the length of a chord that has a central angle of 60°.
 - (c) Two men are on diametrically opposite sides of a tower. They of elevation of the top of the tower as 20° and 24° respectively. If the height of the tower is 40 m, find the distance between them.
- 4. (a) Prove that angles in the same segment of a circle are equal.
 - (b) AB and CD are two equal intersecting chords of a circle whose centre is O. If M and N are respectively the mid-points of AB and CD, prove that ∠OMN=∠ONM.
 - (c) In cyclic trapezium ABCD in which AD | BC, show that AB=CD.
- 5. (a) If the corresponding sides of two triangles are proportional, then prove that they are similar.
 - (b) In △ABC, ∠BAC=90° and segment AD is perpendicular to the hypotenuse BC. Prove that AD²=BD×DC.
 - (c) PQ and PR are equal chords of a circle. Prove that the tangent to the circle at P is parallel to the chord QR.
- 6. (a) Find the real values satisfying $x^4-2x^2-3=0$.
 - (b) Express $\left(\frac{x+1}{x-1} + \frac{x-1}{x+1}\right)^2$ as a rational expression.
 - (c) Some students planned a picnic. The budget for food was Rs. 24. Because four of the group failed to go, the cost of food to each member got increased by Re. 1. How
- 7. (a) Find the area of a triangle whose sides are 2.22 m, 2.46 m and 1.9 m.

- (b) A metallic sphere of radius 10.5 cm is melted and then recast into small cones, each of radius 3.5 cm and height 3 cm. Find how many such cones are formed?
- (c) A 20-metre deep well with diameter 14 metres is dug up and the earth from digging is spread evenly to form a platform 22 m×14 m. Determine the height of the platform.
- 8. (a) The mean monthly salary paid to 75 employees in a company is Rs. 1420. The mean salary of 25 of them is Rs. 1350 and that of 30 others is Rs. 1425. Find the mean salary of the remaining employees.
 - (b) In a study on certain disease, the following data was obtained. Find the average at first detection.

Age at first detection (in years)	Number of patients
2-6	1
6-10	9
10—14	21
14—18	47
18—22	52
22—26	36
26-30	19
30-34	3

9. Draw a flow chart to find the sum of cubes of First 10 numbers

i.e.,
$$1^3+2^3+3^3+\dots 10^3$$

TEST PAPER 2

(Time Allowed: 3 hours)

- 1. Fill in the blanks to make each of the following a true statement:
 - (a) If a perpendicular is drawn from the centre of a circle to a chord, then the foot of the perpendicular.....the chord.
 - (b) In the figure, if AD is the bisector of ∠BAC, then AB=.....cm.
 - (c) The value of $\frac{\sin 40^{\circ}}{\cos 50^{\circ}}$ is
 - (d) The zeros of polynomial x^2-9 are......
 - (e) A system of linear equations which has at least one solution is called a system ofequations.
- 2. (a) Find the sum and the product of the roots of the equation

$$4x^2-4x-3=0.$$

(b) Find the value of k for which the system

$$kx+2y=5$$
, $3x+y=1$ has unique solution.

- (c) Find the I.c.m. of (2x-7)(3x+4) and $(2x-7)^2(x+3)$.
- (d) How many transverse common tangents can be drawn to two circles of radii 2.5 cm and 3 cm, their centres being 5 cm apart.
- (e) Find the measures of two opposite angles of a cyclic quadrilateral, if one of them is 7th of the other.
- 3. (a) Prove that $\frac{\sin (90^{\circ} A) \cos (90^{\circ} A)}{\tan A} = 1 \sin^2 A$.

- (b) Prove that $\frac{\sin \theta}{1 + \cos \theta} + \frac{\sin \theta}{1 \cos \theta} = \frac{2}{\sin \theta}$
- (c) From the top of a cliff 100 metres high, the angles of depression of the top and bottom of a tower are observed to be (32.6)° and 45° respectively. Find the height of the tower.
- 4. (a) Prove that a tangent to a circle at any point of it is perpendicular to the radius through the points of contact.
 - (b) Two circles intersect each other at the points P and Q. If AB and AC are tangents to two circles from a point A on the line containing P and Q, prove that AB=AC.
 - (c) AB and CD are equal chords of a circle whose centre is O. When produced, these chords meet at E. Prove that EA=EC.
- 5. (a) Solve $6\left(x^2 + \frac{1}{x^2}\right) 35\left(x + \frac{1}{x}\right) + 62 = 0$
 - (b) Father is six times as old as his son. Four years hence he will be four times as old as his son. Find their present ages.
 - (c) Solve the system of equations

$$11x+15y+23=0
7x-2y-20=0.$$

- 6. (a) If a line divides any two sides of a triangle in the same ratio, prove that the line is parallel to the third side.
 - (b) If a perpendicular is drawn from the vertex containing the right angle of a right triangle to the hypotenuse, then prove that the triangles on each side of the perpendicular are similar to each other.
 - (c) A point O in the interior of a rectangle ABCD is joined with each of the vertices A, B, C and D. Prove that

$OB^2 + OD^3 = OA^2 + OC^2$.

- 7. (a) The circumference of the base of a 9 m high conical tent is 44 m. Find the volume of the air contained in it. (Use π=22/7)
 - (b) Four equal circles are described about the four corners of a square so that each touches two of the others. Find the area of the space enclosed between the circumferences of the circles, each side of the square measuring 14 cm. (Use $\pi = 22/7$)
 - (c) A toy is in the form of a cone mounted on a hemisphere. The diameter of the base of the cone is 6 cm and its height is 4 cm. Compute the surface area of the toy.
- 8. (a) There are 45 students in a class, of which 15 are girls. The average weight of 15 entire class.
 - (b) In a city the following weekly observations were made in a survey of cost of living index for 1970-71. Calculate the average mean weekly cost of living index:

Cost of living index	
140—150	Number of weeks
150-160	5
160-170	10
170—180	20
180-190	9
190-200	6
•	2

9. Draw a flow chart to find the H.C.F. of 30, 45 and 75.

TEST PAPER 3

(Time Allowed: 3 hours)

- 1. Fill in the blanks to make the following statements true:
 - (a) Tangent at any point of a circle is.....to the radius through that point.
 - (b) Two circles are congruent if and only if they have equal......
 - (c) $\sin 50^{\circ} + \cos 40^{\circ} = 2 \sin (\dots)^{\circ}$.
 - (d) The solution set of the system of equations 3x-4y=-7, 3x-4y=-9 is......
 - (e) The volume of a right circular cone =......
- 2. (a) Find the zeros of the polynomial x^2+1 , $x \in \mathbb{R}$.
 - (b) Write down a quadratic equation whose roots are -2 and 3.
 - (c) Find the reciprocal of the rational expression $\frac{x^7 \sqrt{2}x}{8x^7 \sqrt{3}x}$
 - (d) Find the length of a chord which is at a distance of 3 cm from the centre of a circle whose radius is 5 cm.
 - (e) Given a point P in the exterior of a circle. How many secants can be drawn through P to the circle?
- 3. (a) Find the roots of quadratic equation

$$\left(\frac{x}{x-1}\right)^2 + 4\left(\frac{x}{x-1}\right) + 2 = 0, x \neq 1$$

- (b) The sum of the squares of the three consecutive natural numbers is 110. Determine the numbers.
- (c) Simplify: $\frac{x-1}{x-2} \frac{x+1}{x+2} \frac{4}{4-x^2} + \frac{2}{2-x}$
- 4. (a) Prove that the angle subtended by an arc at the centre is double the angle subtended by it any point on the remaining part of the circle.
 - (b) Prove that a cyclic parallelogram is a rectangle.
 - (c) Prove that the tangents at the end-points of a diameter of a circle are parallel.
- 5. (a) Prove that if a line is drawn parallel to one side of a triangle, the other two sides are divided proportionally.
 - (b) ABCD is a trapezium such that AB || DC. If O is the point of intersection of its diagonals, then show that $\frac{OA}{OC} = \frac{OB}{OD}$.
 - (c) In △ABC, AD is perpendicular to BC.

 Prove that

 AB²-BD²=AC²-CD².
- 6. (a) A sector is cut from a circle of radius 21 cm. The angle of the sector is 150°. Find its length and area.
 - (b) A heap of wheat is in the form of a cone of diameter 9 m and height 3.5 m. Find its volume. How much canvas cloth is required to just cover the heap?
 (Use π=3.14)
 - (c) The volumes of a sphere and a right cylinder are equal and the diameter of the sphere equals the diameter of the base of the cylinder. Determine the ratio of the height of the cylinder to the diameter of the sphere.
- 7. (a) Find the value of $\frac{\cos 59^{\circ}}{\sin 31^{\circ}}$

- (b) Prove that $\frac{1+\sin A}{\cos A} + \frac{\cos A}{1+\sin A} = \frac{2}{\cos A}$.
- (c) A kite flying at a height of 65 metres is attached to a string inclined at 31° to the horizontal. What is the length of the string? Assume that the string is tight.
- 8. (a) Following is the distribution of earnings of 200 workers in a flour mill:

Monthly wages (in rupees)	No. of workers
80-100	20
100120	30
120—140	20
140—160	40
160-180	90

Find the average earnings of the workers.

- (b) The mean of 30 values was 150. It was detected on rechecking that one value 165 was wrongly copied as 135 for the computation of the mean. Find the correct mean.
- 9. A bicycle is sold at a profit of 12%. Had it been sold for Rs. 180 more, 18% would have been gained. Find its cost price. Draw the flow chart for solving the above problem.

TEST PAPER 4

(Time Allowed: 3 hours)

- 1. Fill in the blanks, making each of the following a true statement:
 - (a) Equal chords of a circle are......from the centre.
 - (b) The value of $\frac{\cos 20^{\circ} \ 35'}{\sin 69^{\circ} \ 25'}$ is.......
 - (c) In the figure, if ∠BDC=30° and ∠CBA=110°, then ∠BCA=......
 - (d) Two tangents to a circle from an external point are......
 - (e) $3x^3+7x^2+5$ is a polynomial of degree..... in x.

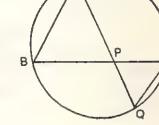

- (b) Reduce the rational expression $\frac{x+1}{2x^2+x-1}$ to its lowest terms.
- (c) The ratio of any two corresponding sides of two similar triangles is 3:2. Find the ratio of the areas of these triangles.
- (d) When do two linear equations in x and y have no common solution?
- (e) What is the total surface area of a hemisphere whose radius is x cm?
- 3. (a) Solve $\frac{1}{x+7} + \frac{1}{x+3} = \frac{6}{5}, x \in \mathbb{R}$.
 - (b) Solve the system of equations:

$$5x+2y+13=0$$
 and $7x-5y+26=0$.

(c) The length of a room is 3 metres more than its breadth. If the area of the room is 70 sq. metres, determine the dimensions of the room.

- 4. (a) Prove that if two circles touch each other, the point of contact lies on the line joining their centres.
 - (b) ABCD is a cyclic quadrilateral. A circle passing through A and B meets AD and BC in the points E and F respectively. Prove that EF is parallel to DC.

- (c) In the figure, P is a point on the chord BC such that AB=AP. Prove that CP=CQ.
- 5. (a) Prove that $\frac{\cos A}{1-\tan A} + \frac{\sin^2 A}{\sin A \cos A} = \sin A + \cos A$.
 - (b) Show that $\cos \theta \cos (90^{\circ} \theta) \sin \theta \sin (90^{\circ} \theta) = 0$.
 - (c) A ladder leaning against a vertical wall makes an angle of 20° with the ground. The foot of the ladder is 3 metres from the wall. Determine the length of the ladder.
- 6. (a) Prove that in a right triangle the square on the hypotenuse is equal to the sum of the squares on the other two sides.
 - (b) If two sides and a median bisecting one of these sides of a triangle are respectively proportional to the two sides and the corresponding median of another triangle, then prove that the two triangles are similar.
 - (c) Prove that the bisector of an angle of a triangle divides the opposite side in the ratio of the sides containing the angle.
- 7. (a) The length of the minutes hand of a clock is 14 cm. Find the area swept by the minutes hand in one minute and in one hour. (Take $\pi=3.14$)
 - (b) A cone of height 24 cm, has a curved surface area 550 cm². Find its volume.

$$\left(\text{Take }\pi = \frac{22}{7}\right)$$

- (c) A cylindrical jar of radius 6 cm contains oil. Iron spheres, each of radius 1.5 cm are immersed in the oil. How many such spheres are necessary to raise the level of the oil by 2 cm?
- 8. (a) The mean of the following frequency table is 50. But the frequencies f_1 and f_2 in classes 20-40 and 60-80 are missing. Find the missing frequencies:

Class	Frequency
0-20	17
20-40	f_1
40-60	32
6080	f_2
80-100	19
Total	120

(b) In a study to test a new variety of wheat, an experiment was performed on 50 similar plots (under similar conditions) and the following results were obtained:

Yield per hectare (in quintals)	Number of fields
10-20	. 2
20-30	7
30-40	12
40-50	15
50-60	8
60-70	6

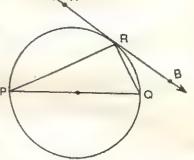

Find the mean yield per hectare from the above data.

9. A man had Rs. 2,000, part of which he lend at 5% and the rest at 4%. The whole annual interest received was Rs. 92. How much did he lent at 5%? Write the algorithm for the above problem and draw its flow chart.

TEST PAPER 5

(Time Allowed: 3 hours)

- 1. Fill in the blanks to make the following statements true:
 - (a) In the figure, if AB is a tangent to the circle at R, PQ is a diameter of the circle and ∠RPQ=25°, then ∠ARP=..........
 - (b) If the opposite angles of a quadrilateral are supplementary, then the quadrilateral is.......
 - (c) The value of $\frac{\sin 10^{\circ}}{\cos 80^{\circ}}$ is.....
 - (d) The solution of the system of equation x+y=5, P x-y=3 is......
 - (e) If the discriminant D of a quadratic equation $ax^2+bx+c=0$, $a\neq 0$, is zero, the roots are......

- 2. (a) One root of the equation $3x^2-10x+3=0$ is $\frac{1}{3}$. Find the other root.
 - (b) Express $(x^2+2)+\frac{2x}{x+1}$ as a rational expression.
 - (c) Find the measures of two opposite angles of a cyclic quadrilateral, if one of them is $\frac{11}{4}$ th of the other.
 - (d) The perimeters of two similar triangles are 24 cm and 18 cm respectively. If one side of the first triangle is 8 cm, find the corresponding side of the other triangle.
 - (e) The mean of the numbers 6, y, 7, x, 14 is 8. Express y in terms of x.
- 3. (a) Prove that $\left(\frac{1+\cos\theta}{\sin\theta}\right)^2 = \frac{1+\cos\theta}{1-\cos\theta}$.
 - (b) Prove that $\sin \theta \cos (90^{\circ} \theta) + \cos \theta \sin (50^{\circ} \theta) = 1$.
 - (c) The shadow of Qutab Minar is 81 metres long when the angle of elevation of the sun is 41° 30'. Find the height of Qutab Minar.
- 4. (a) Prove that the perpendicular from the centre of a circle to a chord bisects the chord.

- (b) If the sides of a quadrilateral touch a circle, prove that the sum of a pair of opposite sides is equal to the sum of the other pair.
- (c) P is the mid-point of an arc APB of a circle. Prove that the tangent at P is parallel to the chord AB.
- 5, (a) Prove that the ratio of the areas of two similar triangles is equal to the ratio of the squares of any two corresponding sides.
 - (b) In \triangle ABC, \angle BCA is a right angle. Q is the mid-point of the side BC. Prove that BC²=4 (AO²-AC²).
 - (c) Prove that any line parallel to parallel sides of a trapezium divides the non-parallel sides proportionally.
- 6. (a) Following are the data on the daily wages of casual labour employed by a group of limited concern:

Daily wages (in rupees)	Frequency
4- 6	6
6 8	5
8-10	10
10-12	8
12-14	3
14-16	2
Total	34

- (b) A school has 4 sections of chemistry in class XI having 40, 35, 45 and 42 students. The mean marks obtained in chemistry test are 50, 60, 55 and 45 respectively for the 4 sections. Determine the overall average of marks per student.
- 7. (a) Solve $\sqrt{x^2-16} (x-4) = \sqrt{x^2-5x+4}$.
 - (b) Find the quadratic equation whose roots are reciprocals of the roots of the equation $3x^2-20x+17=0$.
 - (c) Solve the following system of equations by graphical method:

8. (a) How many spherical bullets can be made out of a cube of lead whose edge measures 22 cm, each bullet being 2 cm in diameter? Take $\pi = \frac{22}{7}$

- (b) Given a circle with radius 3.5 cm. Find the area of its sector with central angle 30°.
- (c) A well with 10 metres inside diameter is dug 14 metres deep. Earth taken out of it has been spread evenly around it to a width of 5 cm. Find the height of the embarkment so formed.
- 9. A fort had provisions for 150 men for 45 days. After 10 days 25 men left the fort. How long will the food last at the same rate? Draw a flow chart for solving the above problem.

11. 4.5 metres/minute

13. 7, 8 14.
$$\frac{3}{5}$$
, $\frac{5}{3}$

16.
$$x=3$$

16.
$$x=3$$
 17. 6 cm, 4 cm

19.
$$\frac{-5+\sqrt{533}}{2}$$
 cm

3 (
$$\sqrt{5}$$
-1) cm internally; -3 ($\sqrt{5}$ +1) cm externally
9, 10, 11 25. Father 42 years, Son 3 years

27. (i)
$$\frac{200}{x}$$
 hours, $\frac{200}{x+5}$ hours

28.
$$x = 100$$

Review Exercise II

1. (a)
$$-92$$

(b)
$$p^2-4q<0$$

(b)
$$p^2-4q < 0$$
 (c) $q^2-4pr=0$

(d)
$$x^2-2x-15=0$$

(h) $\frac{3}{2}$

(e)
$$-5$$

(e)
$$-5$$
 (f) $x^3-2x-2=0$ (g) two

(h)
$$\frac{3}{2}$$

2. (a)
$$-\frac{7}{3}$$
 (b) 1 3. $x^2-6x+7=0$

3.
$$x^2 - 6x + 7 =$$

5.
$$x = \frac{9}{5}, x = -\frac{4}{3}$$

6.
$$y=\frac{1}{3}$$
, $y=-\frac{1}{16}$

7.
$$y=1, y=\frac{1}{10}$$

8.
$$y=4, y=\frac{13}{2}$$

9.
$$x=4, x=-1$$

11. Length 10 m, Breadth 7 m
12.
$$(3-\sqrt{5})$$
 m *i.e.* 76 cm nearly

RATIONAL EXPRESSIONS

Exercise 3 (a)

1.
$$(x-3)(x+1)^3$$

2.
$$2(x-1)(x+1)^2$$

3.
$$x-2$$

4.
$$2x+3$$

5.
$$4x^2(2x+1)$$

6.
$$(x+3)(x-6)(x-2)^2$$

7.
$$(x+3)(x+4)^2$$

8.
$$-(x+1)(x+3)(x-2)$$

9.
$$-(x+3)^2(2x+1)(3x-4)$$

10.
$$(x^3+2x-3)(x^3-x^2-5x+2)$$

Exercise 3 (b)

2.
$$\frac{ax+b}{cx^2+dx+e}, a\neq 0, c\neq 0.$$

3. $\frac{ax^m+b}{cx^n+dx^p+ex^r}$, where m, n, p, r are natural numbers and a, b, c, d, e are non-zero real numbers.

4. $\frac{x^3+x-2}{3x^2-7x+2}$

Exercise 3 (c)

1.
$$\frac{(x+3)(x-2)}{x-1}$$

2.
$$\frac{(x+2)(x-3)}{(x+1)(x-2)}$$

$$3. \frac{3}{5}$$

4.
$$-\frac{1}{x+3}$$

$$5. \quad \frac{x-3}{x+1}$$

6.
$$\frac{x+3}{2x^2}$$

7.
$$\frac{x-4}{x-3}$$
 8. $\frac{x+1}{2x+1}$

8.
$$\frac{x+1}{2x+1}$$

9.
$$\frac{2x+1}{2x-3}$$

10.
$$\frac{5(3x-1)}{x-5}$$
 11. $\frac{2x-5}{3x-2}$ 12. $\frac{2x+y}{2x+3y}$

11.
$$\frac{2x-5}{3x-2}$$

12.
$$\frac{2x+y}{2x+3y}$$

Exercise 3 (d)

1.
$$\frac{x+a}{x-a}$$

2.
$$\frac{2x-5}{x+5}$$

3.
$$\frac{2x^3-2}{x+3}$$

$$5, \quad \frac{x^2+y^2}{xy}$$

6.
$$\frac{a-c}{ac}$$

7.
$$\frac{2x^2+2x-7}{(x+3)(x-2)}$$
 8. $\frac{x+6}{9x(x+1)}$

8.
$$\frac{x+6}{9x(x+1)}$$

9.
$$\frac{2x-6}{x^2-36}$$
 10. $\frac{2(x^2+1)}{(x-1)^2(x+1)}$

10.
$$\frac{(x-1)^2}{(x-1)^2}$$

TEST PAPERS

Test Paper 1.

- 1. (a) 0
- (b) 3 cm

(c) 114°

(d) 7

2. (a) $0; -\sqrt{3}$

(e) P(a) = 0.

- (e) (x-4)(x+3).
- (b) No

- (c) Inconsistent
- (d) 2x-7

- 3. (b) 6 cm
- (c) 199.73 metres.
- 6. (a) $x = \pm \sqrt{3}$
- (b) $\frac{4(x^2+1)^2}{}$ $(x^2-1)^2$
- (c) 8

- 7. (a) 2.016 m²
- (b) 126

(c) 10 m

- 8. (a) Rs. 1500
- (b) 19.2 years.

Test Paper 2.

- 1. (a) bisects
- (b) 10 cm

(c) 1

(d) +3, -3

- (e) consistent. 2. (a) 1; $-\frac{3}{4}$
- (b) $k = \pm 6$
- (d) No, the two circles intersect each other.
- 3. (c) 36.05 m
- 5. (a) $2, \frac{1}{2}, 3, \frac{1}{3}$
- (b) 6 yrs., 36 yrs.
- 7. (a) 462 m³
- (b) 42 cm^2

(c) x=2; y=-3

(c) $(2x-7)^2(x+3)(3x+4)$

(c) 66 cm²

(e) 40°, 140°

- 8. (a) 49.67 kg
- (b) 166.35

Test Paper 3.

1. (a) perpendicular (b) radii

(c) 50°

 $(d) \phi$

(e) $\frac{1}{3} \pi r^2 h$

2. (a) Has no zeros (b) $x^2-x-6=0$ (c) $\frac{8x^7-\sqrt{3}x}{x^7-\sqrt{2}x}$ (d) 8 cm

(e) many

(a) $\frac{2-\sqrt{2}}{3-\sqrt{2}}$, $\frac{2+\sqrt{2}}{3+\sqrt{2}}$ (b) 5, 6, 7 (c) zero

6. (a) 55 cm; 577.5 cm² (b) 74.18 m³; 80.54 m² (c) 2:3

7. (a) 1

(c) 126⁻21 m

8. (a) Rs. 145

(b) 151.

Test Paper 4.

1. (a) equidistant (b) 1

(c) 40°

(d) equal

(e) three

2. (a) $k = \pm 4$

(b) $\frac{1}{2x-1}$ (c) 9:4 (d) when inconsistent

(e) $3\pi x^2 \text{ cm}^2$

3. (a) -2, $\frac{-19}{3}$ (b) x=-3, y=1 (c) 10 m, 7 m

5. (c) 3'19 m

7. (a) $10^{\circ}26 \text{ cm}^2$; $615^{\circ}44 \text{ cm}^2$ (b) 1232 cm^2 8. (a) $f_1=28, f_2=24$ (b) $42^{\circ}6$ quintals per hecta

(c) 16

(e) real and equal

(b) 42.6 quintals per hectare

Test Paper 5.

1. (a) 65°

(b) cyclic

(c) 1 (d) x=4, y=1

2. (a) 3

(b) $\frac{x^2+x^2+4x+2}{x+1}$ (c) 48°, 132°

(d) 6 cm

(e) y=13-x 3. (c) 71.66 m

6. (a) Rs. 9.18 7. (a) x=4, 5

(b) 52·3

(b) $17x^2-20x+3=0$ (c) x=5, y=1

8. (a) 2541 (b) 3.21 cm⁸

(c) 4.67 m.
